- 53.** y is differentiable for all $x \neq -3$.

At $(-3, 0)$, the graph has a node.

- 54.** y is differentiable for all $x \neq \pm 3$.

At $(\pm 3, 0)$, the graph has a cusp.

- 55.** y is differentiable for all $x \neq -2^{\frac{1}{2}}$.

At $(-2^{\frac{1}{2}}, 0)$, the graph has a vertical tangent line.

- 56.** y is differentiable for all $x > 1$.

The derivative does not exist at endpoints.

- 57.** y is differentiable for all $x \neq \pm 2$.

The function is not defined at $x = \pm 2$.

- 58.** y is differentiable for all $x \neq 0$.

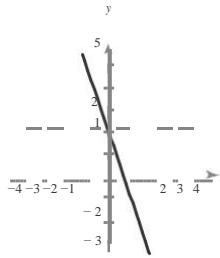

The function is discontinuous at $x = 0$.

59. Since $f'(x) = -3$ for all x , f is a line of the form

$$f(x) = -3x + b.$$

$$f(0) = 2, \text{ so } 2 = (-3)(0) + b, \text{ or } b = 2.$$

Thus, $f(x) = -3x + 2$.

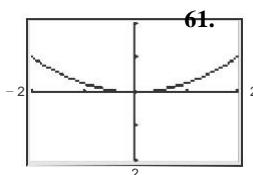

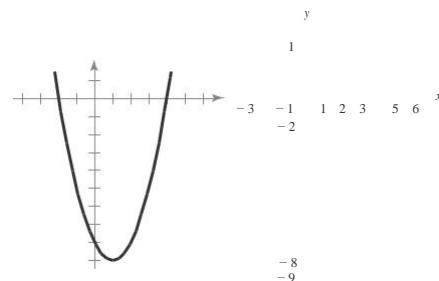

60. Sample answer: Since $f(-2) = f(4) = 0$, $(x^2 + 2x - 8) = 0$.

A function with these zeros is $f(x) = x^2 + 2x - 8$.

$$\begin{aligned} \text{Then } f'(x) &= \lim_{x \rightarrow 0} \frac{f(x+x) - f(x)}{x} \\ &= \lim_{x \rightarrow 0} \frac{(x+2)^2 + 2(x+2) - (x^2 + 2x - 8)}{x} \\ &= \lim_{x \rightarrow 0} \frac{x^2 + 4x + 4 + 2x + 4 - x^2 - 2x + 8}{x} \\ &= \lim_{x \rightarrow 0} \frac{2x + 12}{x} \\ &= \lim_{x \rightarrow 0} 2 + \frac{12}{x} \\ &= 2x + 2. \end{aligned}$$

So $f'(1) = 2(1) + 2 = 0$. Sketching $f(x)$ shows that

$$f'(x) < 0 \text{ for } x < 1 \text{ and } f'(x) > 0 \text{ for } x > 1.$$

Chapter 2 Differentiation
 $C = x^3 - 15x^2 + 87x - 73$, $4 \leq x \leq 9$

$$\frac{dC}{dx}$$

Marginal cost: $dx = 3x^2 - 30x + 87$

$$\frac{C}{x} = x^2 - 15x + 87 - \frac{73}{x}$$

(b) Point of intersection:

$$3x^2 - 30x + 87 = x^2 - 15x + 87 - \frac{73}{x}$$

$$2x^2 - 15x + \frac{73}{x} = 0$$

$$2x^3 - 15x^2 + 73 = 0$$

$$x \approx 6.683$$

$$\text{When } x = 6.683, \frac{C}{x} = \frac{dC}{dx} \approx 20.50.$$

Thus, the point of intersection is (6.683, 20.50).
 At this point average cost is at a minimum.

(a) As time passes, the percent of people aware of the product approaches approximately 95%.

As time passes, the rate of change of the percent of people aware of the product approaches zero.

71. $C = 100 \frac{200}{x^2} + \frac{x}{x+30}, x \geq 1$

$$C = 100 - 2(200x^{-3}) + \left(\frac{x}{x+30}\right)^2$$

$$= \frac{400}{x^3} + \frac{30}{(x+30)^2}$$

(a) $C'(10) = 100 - \frac{400}{10^3} + \frac{30}{40^2} = -38.125$

$$C'(15) \approx -10.37$$

$$C'(20) \approx -3.8$$

Increasing the order size reduces the cost per item.

An order size of 2000 should be chosen since the cost per item is the smallest at $x = 20$.

(c) Marginal profit: $P' = -\frac{5x}{4} + \frac{75}{4} = 0 \quad x = 15$

This is the maximum point on the graph of P , so selling 15 units will maximize the profit.

Graph A is the position function. Graph B is the velocity function. Graph C is the acceleration function.

Explanations will vary. Sample explanation:

The position function appears to be a third-degree function, while the velocity is a second-degree function, and the acceleration is a linear function.

(c) Over the interval $8 \leq t \leq 13$, $y(t) > 0$; therefore,

True. If $y = (x+1)(x+2)(x+3)(x+4)$, then y is a fourth-degree polynomial function and its fifth derivative $\frac{dy}{dx^5}$ equals 0.

- 44.** True. The second derivative represents the rate of change of the first derivative, the same way that the first derivative represents the rate of change of the function.
