#### **Solution Manual:**

https://testbankpack.com/p/solution-manual-for-c-how-to-program-7th-edition-by-deitel-isbn-9789332555310-9780132990448/

2

# Introduction to C

Programming—Solutions

What's in a name?
That which we call a rose
By any other name would
smell as sweet.
—William Shakespeare

When faced with a decision, I always ask, "What would be the most fun?"

-Peggy Walker

"Take some more tea," the March Hare said to Alice, very earnestly. "I've had nothing yet," Alice replied in an offended tone: "so I can't take more." "You mean you can't take less," said the Hatter: "it's very easy to take more than nothing."—Lewis Carroll

High thoughts must have high language.
—Aristophanes

## Objectives

In this chapter, you'll:

- Write simple computer programs in C.
- Use simple input and output statements.
- Use the fundamental data types.

- Learn computer memory concepts.
- Use arithmetic operators.

- Learn the precedence of arithmetic operators.
- Write simple decisionmaking statements.

# **Self-Review Exercises**

2.1	Fill in the blanks in each of the following.  a) Every C program begins execution at the function				
	ANS: main.				
	b) Every function's body begins with and ends with				
	ANS: left brace, right brace.				
	c) Every statement ends with a(n)				
	ANS: semicolon.				
	d) Thestandard library function displays information on the screen.				
	<ul> <li>ANS: printf.</li> <li>e) The escape sequence \n represents the character, which causes the cursor to position to the beginning of the next line on the screen.</li> </ul>				
	ANS: newline.				
	f) The Standard Library function is used to obtain data from the keyboard.				
	ANS: scanf.				
	g) The conversion specifier is used in a scanf format control string to indicate				
	that an integer will be input and in a printf format control string to indicate that an integer will be output.				
	ANS: %d.				
	h) Whenever a new value is placed in a memory location, that value overrides the previous value in that location. This process is said to be				
	ANS: destructive.				
	i) When a value is read from a memory location, the value in that location is preserved; this process is said to be				
	ANS: nondestructive.				
	j) Thestatement is used to make decisions.				
	ANS: if.				
2.2	State whether each of the following is <i>true</i> or <i>false</i> . If <i>false</i> , explain why.				
	a) Function printf always begins printing at the beginning of a new line.				
	ANS: False. Function printf always begins printing where the cursor is positioned, and this may be anywhere on a line of the screen.				
	b) Comments cause the computer to print the text after the // on the screen when the program is executed.				
	ANS: False. Comments do not cause any action to be performed when the program is executed. They're used to document programs and improve their readability.				
	c) The escape sequence \n when used in a printf format control string causes the cursor to position to the beginning of the next line on the screen.				
	d) All variables must be defined before they're				
	used. ANS: True. e) All variables must be given a type when they're				
	defined. ANS: True.				
	f) C considers the variables number and Number to be identical.				
	ANS: False. C is case sensitive, so these variables are different.				
	<ul> <li>g) Definitions can appear anywhere in the body of a function.</li> <li>ANS: False. A variable's definition must appear before its first use in the code. In Microsoft</li> </ul>				
	Visual C++, variable definitions must appear immediately following the left brace				
	that begins the body of main. Later in the book we'll discuss this in more depth as we				
	encounter additional C features that can affect this issue.				

h) All arguments following the format control string in a printf function must be preced-ed by an ampersand (&).

ANS: False. Arguments in a printf function ordinarily should not be preceded by an ampersand. Arguments following the format control string in a scanf function ordinar-ily should be preceded by an ampersand. We will discuss exceptions to these rules in Chapter 6 and Chapter 7.

- i) The remainder operator (%) can be used only with integer operands. ANS: True.
- j) The arithmetic operators \*, /, %, + and all have the same level of precedence.

ANS: False. The operators \*, / and % are on the same level of precedence, and the operators + and - are on a lower level of precedence.

- k) A program that prints three lines of output must contain three printf statements. **ANS:** False. A printf statement with multiple \n escape sequences can print several lines.
- 2.3 Write a single C statement to accomplish each of the following:
  - a) Define the variables c, this Variable, q76354 and number to be of type int.

ANS: int c, this Variable, q76354, number;

b) Prompt the user to enter an integer. End your prompting message with a colon (:) fol-lowed by a space and leave the cursor positioned after the space.

ANS: printf( "Enter an integer: ");

c) Read an integer from the keyboard and store the value entered in integer variable a.

**ANS:** scanf( "%d", &a);

3

d) If number is not equal to 7, print "The variable number is not equal to 7."

e) Print the message "This is a C program." on one line.

ANS: printf( "This is a C program.\n" );

f) Print the message "This is a C program." on two lines so that the first line ends with C.

**ANS:** printf( "This is a C\nprogram.\n" );

g) Print the message "This is a C program." with each word on a separate line.

**ANS:** printf( "This\nis\na\nC\nprogram.\n" );

h) Print the message "This is a C program." with the words separated by tabs.

**ANS:** printf( "This\tis\ta\tC\tprogram.\n" );

- **2.4** Write a statement (or comment) to accomplish each of the following:
  - a) State that a program will calculate the product of three integers.

ANS: // Calculate the product of three integers

b) Define the variables x, y, z and result to be of type int.

ANS: int x, y, z, result;

c) Prompt the user to enter three integers.

**ANS:** printf( "Enter three integers: ");

d) Read three integers from the keyboard and store them in the variables x, y and z.

**ANS:** scanf( "%d%d%d", &x, &y, &z );

e) Compute the product of the three integers contained in variables x, y and z, and assign the result to the variable result.

**ANS:** result = x \* y \* z;

f) Print "The product is" followed by the value of the integer variable result.

```
ANS: printf( "The product is %d\n", result );
```

2.5 Using the statements you wrote in Exercise 2.4, write a complete program that calculates the product of three integers.
ANS:

```
// Calculate the product
                                  of three integers
   #include <stdio.h>
 4
   int main( void )
5
                                    declare variables
 6
        int x, y, z, result; //
 8
                "Enter three integers: "); // prompt
       scanf( "%d%d%d", &x, &y, &z); // read three integers
Q
        result = x * y * z; // multiply values
10
        printf( "The product is %d\n", result ); // display result
11
12 } // end function main
```

**2.6** Identify and correct the errors in each of the following statements:

```
a) printf("The value is %d\n", &number );
```

ANS: Error: &number. Correction: Eliminate the &. We discuss exceptions to this later.

b) scanf( "%d%d", &number1, number2);

ANS: Error: number2 does not have an ampersand. Correction: number2 should be &number2. Later in the text we discuss exceptions to this.

```
c) if (c < 7); {
    printf("C is less than 7 \ n" );
```

ANS: Error: Semicolon after the right parenthesis of the condition in the if statement. Correction: Remove the semicolon after the right parenthesis. [Note: The result of this error is that the printf statement will be executed whether or not the condition in the if statement is true. The semicolon after the right parenthesis is considered an empty statement—a statement that does nothing.]

```
d) if ( c => 7 ) { printf("C is greater than or equal to 7 n" ); }
```

ANS: Error: The relational operator => should be changed to >= (greater than or equal to).

#### **Exercises**

4

**2.7** Identify and correct the errors in each of the following statements. (*Note:* There may be more than one error per statement.)

```
f) \quad \begin{array}{ll} \text{Scanf( "\%d", anInteger ); ANS:} \\ \text{scanf( "\%d", \&anInteger);} \end{array}
        g) printf( "Remainder of %d divided by %d is \n", x, y, x % y ); ANS: printf(
             ainder of %d divided by %d is %d\n", x, y, x % y );
        h) if (x = y);
                printf(%d is equal
                                       to %d\n", x, y);
        ANS:
               if (x == y)
                  printf( "%d is equal to %d\n", x, y );
          i) print("The sum is %d\n," x + y); ANS:
                printf( "The sum is %d\n", x + y );
        j) Printf( "The value you entered is: %d\n, &value ); ANS: printf(
            e value you entered is: %d\n", value );
        Fill in the blanks in each of the following:
                        are used to document a program and improve its readability.
        ANS: comments.
        b) The function used to display information on the screen is
        ANS: printf.
        c) A C statement that makes a decision is __
        ANS: if.
        d) Calculations are normally performed by statements.
        ANS: assignment.
        e) The_
                              function inputs values from the keyboard.
        ANS: scanf.
2.9
        Write a single C statement or line that accomplishes each of the following:
        a) Print the message "Enter two numbers."
        ANS: printf(
                      "Enter two numbers \n" );
        b) Assign the product of variables b and c to variable a.
        ANS: a = b * c;
        c) State that a program performs a sample payroll calculation (i.e., use text that helps
            to document a program).
         ANS: // Sample payroll calculation program
        d) Input three integer values from the keyboard and place these values in integer
            variables a, b and c.
        ANS: scanf( "%d%d%d", &a,
                                        &b, &c);
2.10
       State which of the following are true and which are false. If false, explain your answer.
        a) C operators are evaluated from left to right.
        ANS: False. Some operators are evaluated left to right and others are evaluated from right
               to left depending on their associativity (see Appendix A).
        b) The following are all valid variable names: _under_bar_, m928134, t5, j7, her_sales,
            his_account_total, a, b, c, z, z2.
        c) The statement printf("a = 5;"); is a typical example of an assignment statement.
        ANS: False. The statement prints a = 5; on the screen.
        d) A valid arithmetic expression containing no parentheses is evaluated from left to right.
        ANS: False. Multiplication, division, and modulus are all evaluated first from left to right,
               then addition and subtraction are evaluated from left to right.
        e) The following are all invalid variable names: 3g, 87, 67h2, h22, 2h.
        ANS: False. Only those beginning with a number are invalid.
2.11
        Fill in the blanks in each of the following:
```

a) What arithmetic operations are on the same level of precedence as multiplication?

ANS: division, modulus.

b) When parentheses are nested, which set of parentheses is evaluated first in an arithmetic expression?

**ANS:** The innermost pair of parentheses.

c) A location in the computer's memory that may contain different values at various times throughout the execution of a program is called a \_\_\_\_\_\_.

ANS: variable.

6

**2.12** What, if anything, prints when each of the following statements is performed? If nothing prints, then answer "Nothing." Assume x = 2 and y = 3.

```
a) printf( "%d", x);

ANS: 2
b) printf( "%d", x + x);

ANS: 4
c) printf( "x=" );
d) printf( "x=%d", x);

ANS: x=2
e) printf( "%d = %d", x + y, y + x);

ANS:5=5
f) z = x + y;

ANS: Nothing. Value of x + y is assigned to z.
g) scanf( "%d%d", &x, &y);

ANS: Nothing. Two integer values are read into the location of x and the location of y.
h) // printf( "x + y = %d", x + y );

ANS: Nothing. This is a comment.
i) printf( "\n" );

ANS: A newline character is printed, and the cursor is positioned at the beginning of the
```

ANS: A newline character is printed, and the cursor is positioned at the beginning of the next line on the screen.

**2.13** Which, if any, of the following C statements contain variables whose values are replaced?

```
a) scanf( "%d%d%d%d%d", &b, &c, &d, &e, &f );
b) p = i + j + k + 7;
c) printf( "%s", Values are replaced." );
d) printf( "a = 5" );
ANS: a and b.
```

**2.14** Given the equation  $y = ax^3 + 7$ , which of the following, if any, are correct C statements for this equation?

```
a) y = a * x * x * x + 7;
b) y = a * x * x * (x + 7);
c) y = (a * x) * x * (x + 7);
d) y = (a * x) * x * x + 7;
e) y = a * (x * x * x) + 7;
f) y = a * x * (x * x + 7);
ANS: a, d, and e.
```

**2.15** State the order of evaluation of the operators in each of the following C statements and show the value of x after each statement is performed.

```
a) x = 7 + 3 * 6 / 2 - 1;

ANS: * is first, / is second, + is third, - is fourth and = is last. Value of x is 15.

b) x = 2 % 2 + 2 * 2 - 2 / 2;

ANS: % is first, * is second, / is third, + is fourth, - is fifth and = is last. Value of x is 3.
```

```
c) x = (3* 9* (3+(9* 3/(3))));
ANS: 5 6 4 2 3 1. The = evaluates last. Value of x is 324.
```

**2.16** Write a program that asks the user to enter two numbers, obtains the two numbers from the user and prints the sum, product, difference, quotient and remainder of the two numbers.

```
ANS:
      // Exercise 2.16 Solution
 1
      #include <stdio.h>
 3
 4
      int main( void )
 5
      {
 6
            int x; // define first number
            int y; // define second number
 8
 9
            printf( "%d", "Enter two numbers: " ); // prompt user
10
            scanf( "%d%d", &x, &y); // read values from keyboard
11
12
            // output results
13
            printf( "The sum is %d\n", x + y );
           printf( The sum is x = x + y); printf( The product is x = x + y); printf( The difference is x = x + y); printf( The quotient is x = x + y); printf( The application is x = x + y);
14
15
16
            printf( "The remainder is %d\n", x % y );
17
      } // end main
18
Enter two numbers: 205
The sum is 25
The product is
The difference is
The quotient is
The remainder is 0
```

- **2.17** Write a program that prints the numbers 1 to 4 on the same line. Write the program using the following methods.
  - a) Using one printf statement with no conversion specifiers.
  - b) Using one printf statement with four conversion specifiers.
  - c) Using four printf statements.

ANS:

```
// Exercise 2.17 Solution
 2
     #include <stdio.h>
 3
 4
     int main( void)
 5
 6
         printf( "1 2 3 4\n\n" ); // part a
 7
 8
         printf( "%d %d %d %d \n\n", 1, 2, 3, 4); //
                                                                  part b
9
         printf( "1 "); // part c
printf( "2 ");
10
11
         printf( "3 ");
12
13
         printf( "4\n");
```

```
14 } // end main

1234

1234

1234
```

**2.18** Write a program that asks the user to enter two integers, obtains the numbers from the user, then prints the larger number followed by the words "is larger." If the numbers are equal, print the message "These numbers are equal." Use only the single-selection form of the if statement you learned in this chapter.

ANS:

```
// Exercise 2.18 Solution
              2 3
                   #include <stdio.h>
              4
                   int main(void)
              5
                       int x; // define first number
              6
                       int y; // define second number
8
              9
                       printf( "%s", "Enter two numbers: " ); // prompt
                       scanf( "%d%d", &x, &y ); // read two integers
             10
11
             12
                       // compare the two numbers
                      if( x > y ) {
    printf( "%d is larger\n", x );
} // end if
             13
             14
             15
16
                      if ( x < y ) { printf( "%d is larger\n", y ); } // end if
             17
             18
             19
20
             21
                       if ( x == y ) {
   puts("These numbers are equal");
             22
             23
                      } // end if
             24
                   } // end main
              Enter two numbers: 5 20
              20 is larger
              Enter two numbers: 239 92
              239 is larger
              Enter two numbers: 17 17
              These numbers are equal
```

**2.19** Write a program that inputs three different integers from the keyboard, then prints the sum, the average, the product, the smallest and the largest of these numbers. Use only the single-selection form of the if statement you learned in this chapter. The screen dialog should appear as follows:

```
Input three different integers: 13 27 14
Sum is 54
Average is 18
Product is 4914
Smallest is 13
Largest is 27
```

```
ANS:
```

```
1
                 // Exercise 2.19 Solution
            23
                 #include <stdio.h>
            4
                int main(void)
            5
            6
                    int a; // define first integer
            7
                    int b; // define second integer
                    int c; // define third integer
            8
            9
                    int smallest; // smallest integer
                    int largest; // largest integer
            10
11
           12
                    printf( "%s", "Input three different integers: " ); // prompt user
                    scanf( "%d%d%d", &a, &b, &c ); // read three integers
           13
14
           15
                    // output sum, average and product of the three integers
                    16
           17
           18
19
                    printf(
                             "Product is
                                           %d\n", a * b * c );
           20
                    smallest = a; // assume first number is the smallest
21
           22
                    if ( b < smallest ) { // is b smaller?</pre>
           23
                       smallest = b;
                    } // end if
           24
25
                    if ( c < smallest ) { // is c smaller?
           26
           27
                       smallest = c;
           28
                    } // end if
29
           30
                    printf( "Smallest is %d\n", smallest );
31
                    largest = a; // assume first number is the largest
           32
33
           34
                    if ( b > largest ) { // is b larger?
                      largest = b;
           35
           36
                    } // end if
37
           38
                    if ( c > largest) { // is c larger?
           39
                       largest = c;
           40
                    } // end if
41
          42
                    printf( "Largest is %d\n", largest );
```

43 } // end main

**2.20** Write a program that reads in the radius of a circle and prints the circle's diameter, circum-ference and area. Use the constant value 3.14159 for  $\pi$ . Perform each of these calculations inside the printf statement(s) and use the conversion specifier %f. [Note: In this chapter, we have discussed only integer constants and variables. In Chapter 3 we will discuss floating-point numbers, i.e., val-ues that can have decimal points.]

ANS:

```
// Exercise 2.20 Solution
      #include <stdio.h>
 4
      int main(void)
 6
7
          int radius; // circle radius
 8
          printf( "%s", "Input the circle radius: " ); // prompt user
          scanf( "%d", &radius ); // read integer radius
 0
10
11
           // calculate and output diameter, circumference and area
          printf("\nThe diameter is %d\n", 2 * radius );
printf("The circumference is %f\n", 2 * 3.14159 * radius );
printf( "The area is %f\n", 3.14159 * radius * radius );
12
13
14
15
      } // end main
Input the circle radius: 9
The diameter is
                    1.8
The circumference is 56.548620
The area is 254.468790
```

2.21 Write a program that prints a box, an oval, an arrow and a diamond as follows:

```
8
        printf( "%s", "*
                                                                                   *\n");
        printf( "%s", "*
 9
                                                                                    *\n");
        printf( "%s",
10
                                                                                    *\n");
        printf( "%s",
                                                                                    *\n");
11
12
        printf( "%s",
                                                                                  *\n");
13
        printf( "%s", "
                                                                               * *\n" );
14
        printf( "%s",
                                                                                *\n");
15 } // end main
```

**2.22** What does the following code print?

```
printf( "*\n**\n***\n***\n****\n" );
```

ANS:

11

```
*
**
**
**
**
**
**
**
**
**
**
**
**
```

**2.23** Write a program that reads in three integers and then determines and prints the largest and the smallest integers in the group. Use only the programming techniques you have learned in this chapter.

```
// Exercise 2.23 Solution
     #include <stdio.h>
     int main( void )
 5
     {
 6
         int largest; //
                            largest integer
         int smallest; //
                            smallest integer
 8
         int int1; //
                        define int1 for user input
9
         int int2; //
                        define int2 for user input
10
         int int3; //
                        define int3 for user input
         int temp; //
11
                       temporary integer for swapping
12
13
         printf( "%s", "Input 3 integers: " ); // prompt user and read 3 ints
14
15
         scanf( "%d%d%d%d%d", &largest, &smallest, &int1, &int2, &int3 );
16
         if ( smallest > largest ) { // make comparisons
17
             temp = largest;
             largest = smallest;
18
19
             smallest = temp;
20
21
        } // end if
22
         if ( int1 > largest ) {
23
             largest = int1;
24
25
        } // end if
26
         if ( int1 < smallest ) {</pre>
27
             smallest = int1;
28
        } // end if
```

```
29
 30
          if ( int2 > largest ) {
 31
               largest = int2;
 32
          } // end if
 33
 34
          if ( int2 < smallest ) {</pre>
 35
             smallest = int2;
36
37
          } // end if
 38
          if ( int3 > largest ) {
 39
               largest = int3;
 40
          } // end if
 41
 42
          if ( int3 < smallest ) {</pre>
 43
               smallest = int3;
 44
45
          } // end if
 46
           printf( "The largest value is %d\n", largest );
 47
          printf( "The smallest value is %d\n", smallest );
 48
      } // end main
 Input 5 integers: 9 4 5 8 7
  The largest value is
 The smallest value is
                           4
```

**2.24** Write a program that reads an integer and determines and prints whether it is odd or even. [*Hint:* Use the remainder operator. An even number is a multiple of two. Any multiple of two leaves a remainder of zero when divided by 2.]

ANS:

```
// Exercise 2.24 Solution
 1
      #include <stdio.h>
 4
      int main( void )
 5
      {
 6
          int integer; // integer input by user
         printf( "%s", "Input an integer: " ); // prompt
scanf( "%d", &integer ); // read integer
 8
10
11
          // test if integer is even
          if ( integer \% 2 == 0 ) {
12
13
             printf( "%d is an even integer\n", integer );
14
15
         } // end if
16
          // test if integer is odd
          if ( integer % 2 != 0 ) {
17
         printf( "%d is an odd integer\n", integer ); \} // end if
19
20
     } // end main
Input an integer: 78
78 is an even integer
```

```
Input an integer: 79
79 is an odd integer
```

**2.25** Print your initials in block letters down the page. Construct each block letter out of the let-ter it represents as shown below.

ANS:

13

```
// Exercise 2.25 Solution
      #include <stdio.h>
 4
      int main( void )
 5
      {
          puts( "PPPPPPPP");
 6
          puts(
  8
           puts(
 9
           puts( "PP");
          puts("P P\n");
puts(" JJ");
10
11
          puts( "J");
12
          puts("J");
puts("J");
puts("J");
puts(" JJJJJJ\\n");
13
14
15
          puts( "DDDDDDDDD" );
puts( "D D" );
16
                               D" );
D" );
 17
          puts( "D
 18
           puts( " D
                              D" );
 19
           puts( " DDDDD" );
20
21
      } // end main
```

**2.26** Write a program that reads in two integers and determines and prints if the first is a multiple of the second. [*Hint:* Use the remainder operator.]

```
1 // Exercise 2.26 Solution
```

14

```
#include <stdio.h>
 4
      int main( void )
 5
     {
         int integer1; // first integer
int integer2; // second integer
 6
  8
 9
          printf( "%s", "Input two integers: "); // prompt user
10
          scanf( "%d%d", &integer1, &integer2); // read two integers
           / use remainder operator
12
13
          if (integer1 % integer2 == 0) {
              printf( "%d is a multiple of %d\n", integer1, integer2 );
14
15
          } // end if
16
          if ( integer1 % integer2 != 0 ) {    printf( "%d is not a multiple of %d\n", integer1, integer2 ); } // end if
17
19
     } // end main
20
Input two integers: 88 11
88 is a multiple of 11
Input two integers: 777 5
777 is not a multiple of
 2.27 Display the following checkerboard pattern with eight printf statements and then display
 the same pattern with as few printf statements as possible.
```

```
// Exercise 2.27 Solution
    #include <stdio.h>
     int main( void )
 5
    {
 6
        puts( "With eight printf() statements:" );
                  "%s", "* * * * * * * * \n");
8
        printf(
               "%s", " * * * * * * * * * \n" );
9
        printf(
        10
11
12
        printf( "%s", " * * * * * * * * * * * \n");
13
```

15

**2.28** Distinguish between the terms fatal error and nonfatal error. Why might you prefer to experience a fatal error rather than a nonfatal error?

ANS: A fatal error causes the program to terminate prematurely. A nonfatal error occurs when the logic of the program is incorrect, and the program does not work properly. A fatal error is preferred for debugging purposes. A fatal error immediately lets you know there is a problem with the program, whereas a nonfatal error can be subtle and possibly go undetected.

**2.29** Here's a peek ahead. In this chapter you learned about integers and the type int. C can also represent uppercase letters, lowercase letters and a considerable variety of special symbols. C uses small integers internally to represent each different character. The set of characters a computer uses together with the corresponding integer representations for those characters is called that comput-er's character set. You can print the integer equivalent of uppercase A, for example, by executing the statement

```
printf( "%d", 'A');
```

Write a C program that prints the integer equivalents of some uppercase letters, lowercase letters, digits and special symbols. As a minimum, determine the integer equivalents of the following: A B C a b c 0 1 2 \$ \* + / and the blank character.

```
1 // Exercise 2.29 Solution
2 #include <stdio.h>
3
```

int main( void )

```
5
             printf( "A's integer equivalent is %d\n", 'A');
printf( "B's integer equivalent is %d\n", 'B');
 6
 7
              printf( "C's integer equivalent is %d\n", 'C');
 8
             printf( "a's integer equivalent is %d\n", 'a');
printf( "b's integer equivalent is %d\n", 'b');
printf( "c's integer equivalent is %d\n", 'c');
10
11
             printf( "0's integer equivalent is %d\n", '0');
printf( "1's integer equivalent is %d\n", '1');
printf( "2's integer equivalent is %d\n", '2');
12
13
14
             printf( "$'s integer equivalent is %d\n", '$');
printf( "$'s integer equivalent is %d\n", '$');
printf( "*'s integer equivalent is %d\n", '+');
printf( "+'s integer equivalent is %d\n", '+');
15
16
17
              printf( "/'s integer equivalent is %d\n", '/');
18
              printf( "The blank character's integer equivalent is %d\n", ' ');
19
20
       } // end main
A's integer equivalent is
                                          65
 B's integer equivalent is
                                          66
                                          67
97
 C's integer equivalent is
a's integer equivalent is
b's integer equivalent is
 c's integer equivalent is
 0's integer equivalent is
                                          48
                                          49
 1's integer equivalent is
                                          50
 2's integer equivalent is
 $'s integer equivalent is
                                          36
 *'s integer equivalent is
+'s integer equivalent is
                                          42
 /'s integer equivalent is
                                          47
 The blank character's integer equivalent is
                                                                       32
  2.30 Write a program that inputs one five-digit number, separates the number into its
  individual digits and prints the digits separated from one another by three spaces each. [Hint:
  Use combina-tions of integer division and the remainder operation.] For example, if the user
  types in 42139, the program should print
```

```
4 2 1 3 9
```

```
1  // Exercise 2.30 Solution
2  #include <stdio.h>
3
4  int main( void )
5  {
6   int number; // number input by user
7  int temp; // temporary integer
8
9   printf( "%s", "Enter a five-digit number: " ); // prompt user
10   scanf( "%d", &number); // read integer
```

```
17
```

```
printf( "%d ", number / 10000 ); // print leftmost digit
12
         temp = number \% 10000;
13
14
         printf( " %d ", temp / 1000 );
15
         temp = temp \% 1000;
16
17
18
         printf( " %d ", temp / 100 );
19
20
         temp = temp \% 100;
21
         printf( " %d ", temp / 10 );
22
23
         temp = temp \% 10;
         printf( " %d\n", temp ); // print right-most digit
25
     } // end main
Enter a five-digit number: 23456
2 3 4 5 6
```

**2.31** Using only the techniques you learned in this chapter, write a program that calculates the squares and cubes of the numbers from 0 to 10 and uses tabs to print the following table of values:

```
square
0
                 cube
0
number
                 1
                 27
        16
                  64
        25
                  125
        36
        49
                  343
                  512
10
        100
                  1000
         ANS:
```

```
// Exercise 2.31 Solution
 1
     #include <stdio.h>
 4
     int main( void )
 5
 6
7
         int count = 0; // initialize count to zero
8
         // calculate the
                            squares and cubes
                                                  for the numbers 0 to 10
         puts( "\nnumber\tsquare\tcube");
printf( "%d\t%d\tn", count, count * count,
9
10
             count * count * count );
13
         count = count + 1; // increment count by 1
         printf( "%d\t%d\t%d\n", count, count * count,
14
15
             count * count * count );
16
17
         count = count + 1;
18
         printf( "%d\t%d\t%d\n", count, count * count,
```

```
19
             count * count * count );
20
21
          count = count + 1;
22
          printf( "%d\t%d\n", count, count * count,
23
24
             count * count * count );
25
26
          count = count + 1;
printf( "\frac{1}{2} count, count * count,
27
             count * count * count );
28
29
          count = count + 1;
          printf( "%d\t%d\t%d\n", count, count * count,
30
31
             count * count * count );
32
33
          count = count + 1;
34
          printf( "%d\t%d\t%d\n", count, count * count,
35
             count * count * count );
36
37
          count = count + 1;
          printf( "%d\t%d\n", count, count * count,
38
39
             count * count * count );
40
41
          count = count + 1;
42
          printf( "%d\t%d\n", count, count * count,
43
             count * count * count );
44
45
          count = count + 1;
46
          printf( "%d\t%d\n", count, count * count,
47
             count * count * count );
48
         count = count + 1;
printf( "%d\t%d\t%d\n", count, count * count,
    count * count * count );
49
50
51
52
     } // end main
```

#### **Making a Difference**

**2.32** (*Body Mass Index Calculator*) We introduced the body mass index (BMI) calculator in Exercise 1.11. The formulas for calculating BMI are

```
or
BMI = \frac{weightInPounds \times 703}{hei ghtI nI nc hes \times h eight InI nc hes}
\frac{we ightI nKilog rams}{hei ghtI nMeter s \times h eight In Mete rs}
```

Create a BMI calculator application that reads the user's weight in pounds and height in inches (or, if you prefer, the user's weight in kilograms and height in meters), then calculates and displays the user's body mass index. Also, the application should display the following information from

21

23

the Department of Health and Human Services/National Institutes of Health so the user can eval-uate his/her BMI:

```
BMI VALUES
Underweight: less than 18.5
Normal: between 18.5 and 24.9
Overweight: between 25 and 29.9
Obese: 30 or greater
```

[Note: In this chapter, you learned to use the int type to represent whole numbers. The BMI calculations when done with int values will both produce whole-number results. In Chapter 3 you'll learn to use the double type to represent numbers with decimal points. When the BMI calculations are performed with doubles, they'll both produce numbers with decimal points—these are called "floating-point" numbers.]

```
ANS:
     // Exercise 2.32 Solution: BMI.c
     // Making a Difference: Body Mass Index Calculator
 2
     #include <stdio.h>
 4
 5
     //function main begins program execution
 6
     int main ( void )
     {
 8
        int weight; //
                          weight of the person
         int height; // height of the person
9
10
         int BMI; // user's BMI
11
12
         // get user's height
13
         printf(
                   "%s", "Please enter your
                                                height (in
                                                             inches): ");
         scanf( "%d", &height );
14
15
         // get user's weight
16
17
         printf( "Please enter your weight (in pounds): ");
18
         scanf( "%d", &weight );
19
         BMI = weight * 703 / (height * height); // calculate BMI
20
         printf( "Your BMI is %d\n\n", BMI ); // output BMI
22.
24
         // output data to user
25
         puts( "BMI VALUES" );
26
         puts( "Underweight:\tless than 18.5" );
27
         puts( "Normal:\t\tbetween 18.5 and 24.9");
         puts( "Overweight:\tbetween 25 and 29.9");
28
         puts( "Obese:\t\t30 or greater" );
29
30
     } // end main
```

```
Please enter your height (in inches): 69
Please enter your weight (in pounds): 155
Your BMI is 22

BMI VALUES
Underweight: less than 18.5
Normal: between 18.5 and 24.9
Overweight: between 25 and 29.9

Obese: 30 or greater
```

**2.33** (Car-Pool Savings Calculator) Research several car-pooling websites. Create an application that calculates your daily driving cost, so that you can estimate how much money could be saved by car pooling, which also has other advantages such as reducing carbon emissions and reducing traffic congestion. The application should input the following information and display the user's cost per day of driving to work:

- a) Total miles driven per day.
- b) Cost per gallon of gasoline.
- c) Average miles per gallon.
- d) Parking fees per day.
- e) Tolls per day.

ANS:

```
// Exercise 2.33 Solution
      // Making a Difference: Car-Pool Savings Calculator
       #include <stdio.h>
  4
  5
       // function main begins program execution
      int main ( void )
  6
7
  8
          int miles; //
                            total miles driven per
  9
          int gasCost; // cost per gallon of gasoline
 10
          int mpg; // average miles per gallon
          int parkFee; // parking fees per day
 11
          int tolls; // tolls per day
int total; // total cost
 12
 13
 14
 15
           // get total miles driven
          printf( "%s", "Please enter the scanf( "%d", &miles );
                                                                                 day: ");
 16
                                                   total miles driven per
 17
 19
          // get cost of gas
 20
          printf( "%s", "Please enter the cost per gallon of gasoline: ");
 21
22
          scanf( "%d", &gasCost );
 23
           // get average miles per gallon
 24
          printf( "%s", "Please enter average miles per gallon: " );
 25
          scanf( "%d", &mpg );
 26
 27
           // get parking fees per day
 28
          printf( "%s", "Please enter the parking fees per day: ");
 29
          scanf( "%d", &parkFee );
 30
 31
           // get cost of tolls per day
32
          printf( "%s", "Please enter the tolls per day: " );
```

```
scanf( "%d", &tolls );

// calculate total cost

total = tolls + parkFee + ( miles / mpg ) * gasCost;

printf( "Your daily cost of driving to work is $%d\n", total );

please enter the total miles driven per day: 100

Please enter the cost per gallon of gasoline: 3

Please enter average miles per gallon: 19

Please enter the parking fees per day: 3

Please enter the tolls per day: 4

Your daily cost of driving to work is $22
```
