Introduction to C++
Programming, Input/Output

and Operators

What's in a name? that which we call a rose By any other name would smell as sweet. —William Shakespeare

High thoughts must have high language.

-Aristophanes

One person can make a difference and every person should try.

—John F. Kennedy

Objectives

In this chapter you'll learn:

- To write simple computer programs in C++.
- To write simple input and output statements.
- To use fundamental types.

- Basic computer memory concepts.
- To use arithmetic operators.
- The precedence of arithmetic operators.
- To write simple decisionmaking statements.

Self-Review Exercises

2.1	Fill in the blanks in each of the following. a) Every C++ program begins execution at the function
	ANS: main. b) A(n) begins the body of every function and a(n) ends the body. ANS: left brace ({}), right brace ({})
	c) Most C++ statements end with a(n) . ANS: semicolon. d) The escape sequence \n represents the character, which causes the cursor to
	position to the beginning of the next line on the screen. ANS: semicolon. e) The statement is used to make decisions.
	ANS: if.

- 2.2 State whether each of the following is *true* or *false*. If *false*, explain why. Assume the statement using std::cout; is used.
 - a) Comments cause the computer to print the text after the // on the screen when the pro-gram is executed.
 - **ANS:** False. Comments do not cause any action to be performed when the program is executed. They're used to document programs and improve their readability.
 - b) The escape sequence \n, when output with cout and the stream insertion operator, causes the cursor to position to the beginning of the next line on the screen.

ANS: True.

c) All variables must be declared before they're

used. ANS: True.

- d) All variables must be given a type when they're declared. ANS: True.
- e) C++ considers the variables number and NuMbEr to be identical.

ANS: False. C++ is case sensitive, so these variables are different.

- f) Declarations can appear almost anywhere in the body of a C++ function. **ANS**: True.
- g) The modulus operator (%) can be used only with integer operands. ANS: True.
- h) The arithmetic operators *, /, %, + and all have the same level of precedence.
- ANS: False. The operators *, / and % have the same precedence, and the operators + and have a lower precedence.
- i) A C++ program that prints three lines of output must contain three statements using cout and the stream insertion operator.
- ANS: False. One statement with cout and multiple \n escape sequences can print several lines.
- **2.3** Write a single C++ statement to accomplish each of the following (assume that neither using declarations nor a using directive have been used):
 - a) Declare the variables c, thisisAVariable, q76354 and number to be of type int (in one statement).

ANS: int c, thisIsAVariable, q76354, number;

b) Prompt the user to enter an integer. End your prompting message with a colon (:) fol-lowed by a space and leave the cursor positioned after the space.

ANS: std::cout << "Enter an integer: ";

c) Read an integer from the user at the keyboard and store it in integer variable age.

ANS: std::cin >> age;

d) If the variable number is not equal to 7, print "The variable number is not equal to 7".

```
ANS: if(number!= 7)
    std::cout << "The variable number is not equal to 7\n";</pre>
```

e) Print the message "This is a C++ program" on one line.

```
ANS: std::cout << "This is a C++ program\n";
```

f) Print the message "This is a C++ program" on two lines. End the first line with C++.

```
ANS: std::cout << "This is a C++\nprogram\n";
```

g) Print the message "This is a C++ program" with each word on a separate line.

```
ANS: std::cout << "This\nis\na\nC++\nprogram\n";
```

h) Print the message "This is a C++ program". Separate each word from the next by a tab.

```
ANS: std::cout << "This\tis\ta\tC++\tprogram\n";
```

- **2.4** Write a statement (or comment) to accomplish each of the following (assume that using declarations have been used for cin, cout and end!):
 - a) State that a program calculates the product of three integers.

```
ANS: // Calculate the product of three integers
```

b) Declare the variables x, y, z and result to be of type int (in separate statements) and initalize each to 0.

```
ANS: int x = 0;
int y = 0;
int z = 0;
int result = 0;
```

c) Prompt the user to enter three integers.

```
ANS: cout << "Enter three integers: ";
```

d) Read three integers from the keyboard and store them in the variables x, y and z.

```
ANS: cin >> x >> y >> z;
```

e) Compute the product of the three integers contained in variables x, y and z, and assign the result to the variable result.

```
ANS: result = x * y * z;
```

f) Print "The product is " followed by the value of the variable result.

```
ANS: cout << "The product is " << result << endl;
```

g) Return a value from main indicating that the program terminated successfully.

```
ANS: return 0:
```

2.5 Using the statements you wrote in Exercise 2.4, write a complete program that calculates and displays the product of three integers. Add comments to the code where appropriate. [*Note:*

You'll need to write the necessary using declarations or

directive.] ANS: (See program below.)

```
// Calculate the product of three integers
#include <iostream> // allows program to perform input and output
using namespace std; // program uses names from the std namespace

// function main begins program execution
int main()

{
    int x = 0; // first integer to multiply
    int y = 0; // second integer to multiply
    int z = 0; // third integer to multiply
    int result = 0; // the product of the three integers
```

```
cout << "Enter three integers: "; // prompt user for data
cin >> x >> y >> z; // read three integers from user
result = x * y * z; // multiply the three integers; store result
cout << "The product is " << result << endl; // print result; end line
// end function main
```

2.6 Identify and correct the errors in each of the following statements (assume that the statement using std::cout; is used):

```
a) if (c < 7 );
    cout << "c is less than 7\n":</pre>
```

ANS: Error: Semicolon after the right parenthesis of the condition in the if statement.

Correction: Remove the semicolon after the right parenthesis. [Note: The result of this error is that the output statement executes whether or not the condition in the if statement is true.] The semicolon after the right parenthesis is a null (or empty) statement that does nothing. We'll learn more about the null statement in Chapter 4.

```
b) if (c => 7)
    cout << "c is equal to or greater than 7\n";
ANS: Error: The relational operator =>.
```

Correction: Change $\stackrel{-}{=}$ to >=, and you may want to change —equal to or greater than to —greater than or equal to as well.

Exercises

NOTE: Solutions to the programming exercises are located in the ch02solutions folder.

- 2.7 Discuss the meaning of each of the following objects:
 - a) std::cin

ANS: This object refers to the standard input device that is normally connected to the keyboard.

b) std::cout

ANS: This object refers to the standard output device that is normally connected to the

2.8 Fill in the blanks in each of the following:

```
a) _____ are used to document a program and improve its readability. ANS: Comments
```

b) The object used to print information on the screen is _____.

ANS: std::cout

c) A C++ statement that makes a decision is ____.

ANS: if

d) Most calculations are normally performed by _____ statements.

ANS: assignment

e) The _____object inputs values from the keyboard.

ANS: std::cin

2.9 Write a single C++ statement or line that accomplishes each of the following:

a) Print the message "Enter two numbers".

```
ANS: cout << "Enter two numbers";
```

b) Assign the product of variables b and c to variable a.

```
ANS: a = b * c;
```

c) State that a program performs a payroll calculation (i.e., use text that helps to document a program).

ANS: // Payroll calculation program

d) Input three integer values from the keyboard into integer variables a, b and c.

ANS: cin >> a >> b >> c;

- **2.10** State which of the following are *true* and which are *false*. If *false*, explain your answers.
 - a) C++ operators are evaluated from left to right.
 - **ANS:** False. Some operators are evaluated from left to right, while other operators are evaluated right to left.
 - b) The following are all valid variable names: _under_bar_, m928134, t5, j7, her_sales, his_account_total, a, b, c, z, z2.

ANS: True.

- c) The statement cout << "a = 5;"; is a typical example of an assignment statement.
- ANS: False. The statement is an output statement. The text a = 5; is output to the screen.
- d) A valid C++ arithmetic expression with no parentheses is evaluated from left to right.
- ANS: False. Arithmetic operators can appear in any order in an expression, so the expression is a = b + c * d; actually evaluates from right to left because of the rules of op-erator precedence.
- e) The following are all invalid variable names: 3g, 87, 67h2, h22, 2h.
- ANS: False. h22 is a valid variable name. The others are invalid because they each begin with a digit.
- **2.11** Fill in the blanks in each of the following:
 - a) What arithmetic operations are on the same level of precedence as multiplication?

ANS: division and modulus.

b) When parentheses are nested, which set of parentheses is evaluated first in an arithmetic expression? _____.

ANS: innermost.

c) A location in the computer's memory that may contain different values at various times throughout the execution of a program is called a(n)_____.

ANS: variable.

- **2.12** What, if anything, prints when each of the following C++ statements is performed? If noth-ing prints, then answer —nothing. $\|$ Assume x = 2 and y = 3.
 - a) cout << x;

ANS: 2

b) cout << x + x;

ANS: 4

c) cout << "x=";

ANS: x=

d) cout << "x = " << x;

 $\angle ANS$: x = 2

e) cout << x + y << " = " << y + x;

ANS:5=5

f) z = x + y;

ANS: nothing.

 $g) \quad cin >> x >> y;$

ANS: nothing.

 $\textbf{h)} \hspace{0.1in} // \hspace{0.1in} \text{cout} \hspace{0.1in} << "x \hspace{0.1in} + \hspace{0.1in} \text{y} \hspace{0.1in} = " << \hspace{0.1in} x \hspace{0.1in} + \hspace{0.1in} \text{y};$

ANS: nothing (because it is a comment).

```
i) cout << "\n";
```

ANS: A newline is output which positions the cursor at the beginning of the next line on the screen.

2.13 Which of the following C++ statements contain variables whose values are replaced?

```
a) cin >> b >> c >> d >> e >> f;
b) p = i + j + k + 7;
c) cout << "variables whose values are replaced";</li>
d) cout << "a = 5";</li>
ANS: Parts (a) and (b).
```

2.14 Given the algebraic equation $y = ax^3 + 7$, which of the following, if any, are correct C++ statements for this equation?

```
a) y = a * x * x * x + 7;
b) y = a * x * x * (x + 7);
c) y = (a * x) * x * (x + 7);
d) y = (a * x) * x * x + 7;
e) y = a * (x * x * x) + 7;
f) y = a * x * (x * x + 7);
ANS: Parts (a), (d) and (e).
```

2.15 (*Order of Evalution*) State the order of evaluation of the operators in each of the following C++ statements and show the value of x after each statement is performed.

```
a) x = 7 + 3 * 6 / 2 - 1; ANS:

*, /, +, -, =, 15

b) x = 2 % 2 + 2 * 2 - 2 / 2; ANS:

%, *, /, +, -, =, 3

c) x = ( 3 * 9 * (3 + (9 * 3 / (3))));

ANS: innermost parentheses around 3, *, /, +, *, *, 324
```

2.22 What does the following code print?
