**1-1.** Represent each of the following quantities with combinations of units in the correct SI form, using an appropriate prefix: (a)  $\text{GN} \cdot \text{mm}$ , (b)  $\text{kg} / \text{mm}$ , (c)  $\text{N} / \text{ks}$ , (d)  $\text{kN} / \text{ms}$ .

**SOLUTION**

a)  $\text{GN} \cdot \text{mm} = (10^9)\text{N}(10^{-3})\text{m} = 10^6\text{N} \cdot \text{m} = \text{kN} \cdot \text{m}$       **Ans.**

b)  $\text{kg} / \text{mm} = (10^3)\text{g} / (10^{-3})\text{m} = 10^6\text{g} / \text{m} = \text{Gg} / \text{m}$       **Ans.**

d)  $\text{kN} / \text{ms} = (10^3)\text{N} / (10^{-3})\text{s} = 10^6\text{N} / \text{s} = \text{GN} / \text{s}$       **Ans.**

**s:**

**An**

**a)**  
kN

$\cdot \text{m}$

**b)**  
Gg

/m

**c)**

pN

/s<sup>2</sup>

**d)**

GN

/s

1-2. Evaluate each of the following to three significant figures, and express each answer in SI units using an appropriate prefix: (a) (425 mN), (b) (6730 ms), (e) [723(10)] mm

**SOLUTION**

- a)  $(425 \text{ mN})^2 = [425(10^{-3})\text{N}] = 0.181 \text{ N}$   
 b)  $(67\,300 \text{ s}) = [67.3(10^3)(10^{-3})\text{s}] = 4.53(10^1)\text{s}$   
 e)  $[723(10^3)]/\text{mm} = [723(10^3)](10^{-3})\text{m} = 26.9 \text{ m}$

**Ans.****Ans.****Ans.**

**1-3.** Evaluate each of the following to three significant figures, and express each answer in SI units using an appropriate prefix: (a)  $749 \text{ m}/63 \text{ ms}$ , (b)  $(34 \text{ mm})(0.0763 \text{ Ms})/263 \text{ mg}$ , (c)  $(4.78 \text{ mm})(263 \text{ Mg})$ .

**Ans:**  
 a)  $0.181 \text{ N}$   
 b)  $4.53(10^1)\text{s}$   
 c)  $26.9 \text{ m}$

## SOLUTION

$$\begin{aligned} \text{a) } 749 \text{ m} / 63 \text{ ms} &= 749(10) \text{ m} / 63(10) \text{ s} = 11.88(10) \text{ m/s} \\ &= 119 \text{ mm/s} \end{aligned} \quad \text{Ans.}$$

$$\begin{aligned} \text{b) } (34 \text{ mm})(0.0763 \text{ Ms}) / 263 \text{ mg} &= [34(10^{-7}) \text{ m}][0.0763(10) \text{ s}] / [263(10)^{-3} \text{ g}] \\ &= 9.86(10^0) \text{ m} \cdot \text{s} / \text{kg} = 9.86 \text{ Mm} \cdot \text{s} / \text{kg} \end{aligned} \quad \text{Ans.}$$

$$\begin{aligned} \text{e) } (4.78 \text{ mm})(263 \text{ Mg}) &= [4.78(10^{-3}) \text{ m}][263(10) \text{ g}] \\ &= 1.257(10) \text{ g} \cdot \text{m} = 1.26 \text{ Mg} \cdot \text{m} \end{aligned} \quad \text{Ans.}$$

Ans:

a) 11.9 mm/s

b) 9.86 Mm·s/kg

e) 1.26 Mg·m

**1-4.** Convert the following temperatures: (a) 20°C to degrees Fahrenheit, (b) 500 K to degrees Celsius, (c) 125°F to degrees Rankine, (d) 215°F to degrees Celsius.

## SOLUTION

$$\begin{aligned} \text{a) } T_e &= \left( \frac{5}{9} T_r - 32 \right) \\ 20 \text{ C} &= \left( \frac{5}{9} T_r - 32 \right) \\ T_r &= 68.0 \text{ F} \end{aligned} \quad \text{Ans.}$$

$$\begin{aligned} \text{b) } T_e &= T_c + 273 \\ 500 \text{ K} &= T_c + 273 \\ T_c &= 227 \text{ C} \end{aligned} \quad \text{Ans.}$$

$$\begin{aligned} \text{c) } T &= T_e + 460 \\ T &= 125 \text{ F} + 460 = 585 \text{ R} \end{aligned} \quad \text{Ans.}$$

$$\begin{aligned} \text{d) } T_e &= \left( \frac{5}{9} T_r - 32 \right) \\ T_c &= \frac{5}{9}(215 \text{ F} - 32) = 102 \text{ C} \end{aligned} \quad \text{Ans.}$$

**1-5.** Mercury has a specific weight of 133 kN/m<sup>3</sup> when the temperature is 20°C. Determine its density and specific gravity at this temperature.

## SOLUTION

$$\gamma = \rho g$$

$$133(10^3) \text{ N/m}^3 = \rho (9.81 \text{ m/s}^2)$$

$$\rho = 13558 \text{ kg/m}^3 = 13.6 \text{ Mg/m}^3$$

$$S = \frac{\rho}{1000 \text{ kg/m}^3} = 13.6$$

Ans.

Ans.

1-6. The fuel for a jet engine has a density of 1.32 slug/ft<sup>3</sup>. If the total volume of fuel tanks A is 50 ft<sup>3</sup>, determine the weight of the fuel when the tanks are completely full.

Ans:

$$\rho = 13.6 \text{ Mg/m}^3$$

$$S = 13.6$$

### SOLUTION

The specific weight of the fuel is

$$\gamma = \rho g = (1.32 \text{ slug/ft}^3)(32.2 \text{ ft/s}^2) = 42.504 \text{ lb/ft}^3$$

Then, the weight of the fuel is

$$W = \gamma V = (42.504 \text{ lb/ft}^3)(50 \text{ ft}^3) = 2125.2 \text{ lb} = 2.13 \text{ kip}$$

Ans.

Ans:  
 $\gamma = 42.51 \text{ lb/ft}^3$   
 $W = 2.13 \text{ kip}$

1-7. If air within the tank is at an absolute pressure of 680 kPa and a temperature of 70°C, determine the weight of the air inside the tank. The tank has an interior volume of 1.35 m<sup>3</sup>.

### SOLUTION

From the table in Appendix A, the gas constant for air is  $R = 286.9 \text{ J/kg} \cdot \text{K}$ .

$$p = \rho R T$$

$$680(10^3) \text{ N/m}^2 = \rho (286.9 \text{ J/kg} \cdot \text{K})(70^\circ + 273) \text{ K}$$

$$\rho = 6910 \text{ kg/m}^3$$

The weight of the air in the tank is

$$W = \rho g V = (6910 \text{ kg/m}^3)(9.81 \text{ m/s}^2)(1.35 \text{ m}^3)$$

$$= 91.5 \text{ N}$$

Ans.

Ans:  
 91.5 N

**1-8.** The bottle tank has a volume of  $0.12 \text{ m}^3$  and contains oxygen at an absolute pressure of  $12 \text{ MPa}$  and a temperature of  $30^\circ\text{C}$ . Determine the mass of oxygen in the tank.

### SOLUTION

From the table in Appendix A, the gas constant for oxygen is  $R = 259.8 \text{ J/kg}\cdot\text{K}$ .

$$p = \rho RT$$
$$12(10^6) \text{ N/m}^2 = \rho(259.8 \text{ J/kg}\cdot\text{K})(30^\circ + 273) \text{ K}$$
$$\rho = 152.44 \text{ kg/m}^3$$

The mass of oxygen in the tank is

$$m = \rho V = (152.44 \text{ kg/m}^3)(0.12 \text{ m}^3)$$
$$= 18.3 \text{ kg}$$

**Ans.**

1-9. The bottle tank has a volume of  $0.12 \text{ m}^3$  and contains oxygen at an absolute pressure of 8 MPa and temperature of  $20^\circ\text{C}$ . Plot the variation of the temperature in the tank (horizontal axis) versus the pressure for  $20^\circ\text{C} \leq T < 80^\circ\text{C}$ . Report values in increments of  $\Delta T = 10^\circ\text{C}$ .

**SOLUTION**

| $T_c(^{\circ}\text{C})$ | 20   | 30   | 40   | 50   | 60   | 70   | 80   |
|-------------------------|------|------|------|------|------|------|------|
| $p(\text{MPa})$         | 8.00 | 8.27 | 8.55 | 8.82 | 9.09 | 9.37 | 9.64 |

From table in Appendix A, the gas constant for oxygen is  $R = 259.8 \text{ J}/(\text{kg} \cdot \text{K})$ .  
 For  $T = (20^\circ\text{C} + 273)\text{K} = 293 \text{ K}$ .

$$p = \rho RT$$

$$8(10^6) \text{ N/m}^2 = \rho [259.8 \text{ J}/(\text{kg} \cdot \text{K})] (293 \text{ K})$$

$$\rho = 105.10 \text{ kg/m}^3$$

Since the mass and volume of the oxygen in the tank remain constant, its density will also be constant.

$$p = \rho RT$$

$$\rho = (105.10 \text{ kg/m}^3) [259.8 \text{ J}/(\text{kg} \cdot \text{K})] (T + 273)$$

$$p = (0.02730 T + 7.4539) (10^6) \text{ Pa}$$

$$p = (0.02730 T + 7.4539) \text{ MPa where } T \text{ is in } ^{\circ}\text{C}.$$

The plot of  $p$  vs  $T$  is shown in Fig. a.

**Ans:**  
 $p = (0.0273 T + 7.45) \text{ MPa}$ , where  $T$  is in  $^{\circ}\text{C}$

1-10. Determine the specific weight of carbon dioxide when the temperature is 100°C and the absolute pressure is 400 kPa.

### SOLUTION

From the table in Appendix A, the gas constant for carbon dioxide is  $R = 188.9 \text{ J/kg} \cdot \text{K}$ .

$$p = \rho R T$$

$$400(10^3) \text{ N/m}^2 = \rho(188.9 \text{ J/kg} \cdot \text{K})(100^\circ + 273) \text{ K}$$

$$\rho = 5.677 \text{ kg/m}^3$$

The specific weight of carbon dioxide is

$$\begin{aligned} \gamma &= \rho g = (5.677 \text{ kg/m}^3)(9.81 \text{ m/s}^2) \\ &= 55.7 \text{ N/m}^3 \end{aligned}$$

**Ans.**

**Ans:**

$$55.7 \text{ N/m}^3$$
