- 1. Financial accounting deals with regulated, historical, financial information that pertains to the whole company and is designed primarily to meet the information needs of outsiders. Managerial accounting is concerned with unregulated financial, economic, and nonfinancial data, which pertains more to the sub-units of the organization, that is current and future oriented, and that is designed primarily to meet the information needs of insiders.
- 2. The value-added principle means that management accountants are free to engage in any information gathering and reporting activity so long as the activity adds value in excess of its cost. Estimates of future product costs are permissible in managerial accounting reports for budgeting and product costing but would not be allowed by financial regulations in financial accounting.
- 3. The two dimensions of the TQM program are: (1) management should follow a continuous, systematic problem solving philosophy that encourages achievement of zero defects in production and engages all employees to eliminate waste and errors and to simplify the design and delivery of products and services to customers, and (2) organizations need a strong commitment to customer satisfaction. TQM is being used in business to maintainprofitability in an increasingly competitive global market. In this environment, profit margins are tight, and therefore, inefficiencies can more easily erode business profits. To eliminate waste, errors, and dissatisfied customers, information must be timely and relevant in order to prevent or discover and correct mistakes immediately.

- Both financial and managerial accountants need cost information 4. about the company's products and services. In managerial accounting cost information is useful in product pricing decisions and is an essential part of cost control (comparing actual product cost to budgeted product cost to assess needed improvement) and performance evaluation (assess managers' success in controlling and eliminating unnecessary cost). In financial accounting, cost information about the product is needed to determine ending inventory on the balance sheet and cost of goods sold on the income statement. Product costing in financial accounting can impact the decisions of not only managers but also outsiders such as investors, creditors, and taxing authorities. Product costing information in managerial accounting can affect the product's selling price as well as management's decisions as to whether cost correction changes are needed.
- 5. Costs are assets used in the process of earning revenue but not all costs of the earning process are used in the same period in which they are incurred. Therefore, a cost that is used in the process of earning revenue is recorded as an expense (e.g. administrative salaries and product cost for products sold) and a cost that has future benefit in the earning process is recorded as an asset in the period that it is incurred.
- 6. The cash paid to production workers has not been used to produce revenue but to produce inventory. The revenue is earned when the inventory is sold at which time the cost of salaries associated with those products sold should be expensed as cost of goods sold.
- 7. Product costs associated with goods that have not been sold are recorded in the account called inventory. Inventory cost is shown on the balance sheet as an asset. The amount of total assets and net income will be higher if a product cost is classified as an asset than if it is expensed. Product cost associated with goods that have been sold should be recorded in the account called cost of goods sold. Cost of goods sold is an expense shown on the income statement. The amount of total assets and net income will be lower if a product cost is classified as an asset.

- 8. An indirect product cost cannot be easily or economically traced to a specific product. Product costs that would be considered indirect include costs such as production supplies, salaries of production supervisors, and depreciation, rent, and utilities on factoryfacilities.
- 9. Product costs are all costs incurred to obtain a product or provide a service. These costs are treated as assets, recorded in inventory, and expensed when the associated products are sold. Period costs are all costs not associated with a product. They are associated with the general, selling, and administrative functions of the business and most are expensed in the period in which the associated economic sacrifice is made. A product cost would be the cost of direct materials used in the production of a product. A period cost would be rent on administrative facilities.
- 10. The effects of cost classification on the financial statements can have important implications with respect to the following:
 - (1) The availability of financing - Investors and creditors use financial statement data to predict businesses' future earnings. Favorable financial statements provide evidence of favorable future performance whereas unfavorable financial statements are an indication of possible poor future financial performance. A company with favorable financial performance is more likely to generate sufficient cash flows tomake interest payments, to repay the principal balance of its liabilities, and to pay dividends. Hence, investors and creditors believe they have a greater probability of receiving interest payments, the return of principal, and return on investment when companies show favorable financial statements. Since expenses reduce profit and financial performance, classifying a cost as an expense will inhibit the company's ability to obtain financing. Classifying a cost as anasset, which will increase profit, total assets, and equity, enhances businesses' ability to obtain financing.

10. (Continued)

- (2) Management motivation Executive compensation may be affected by financial statement data. Many managers' bonuses are based on a percentage of net income. If costs are classified as expenses, net income will be reduced which in turn affects managerial income. Managers may even be tempted to misclassify costs in order to manipulate financial statement data to their advantage.
- (3) Income tax considerations With respect to taxes, managers prefer to classify costs as expenses rather than assets. Classifying a cost as an expense reduces net income and in turn reduces income taxes, which are determined by computing a designated percentage of taxable income.
- 11. Cost allocation is the process of dividing a total cost into parts and assigning the parts to relevant objects. The determination of interest expense on a note payable is an allocation. If the note pays \$1,200 of interest a year and has been outstanding for 3 months, then 3/12 or \$300 of the \$1,200 total interest expense should be allocated to interest expense for the three-month period. The remaining 9/12 of interest would be allocated to interest expense for the remaining 9 months of the year.
- 12. In recognition of its responsibility to uphold high ethical standards of conduct, the Institute of Management Accountants issued a Statement of Ethical Professional Conduct. The statement sets forth professional ethical standards covering the areas of competence, confidentiality, integrity, and objectivity that management accountants are required to abide by in order to maintain their professional and personal integrity.

- 13. Some of the more common ethical conflicts encountered by accountants include the following:
 - (1) Pressure to perform duties for which they are not competently trained.
 - (2) Pressure to disclose confidential information.
 - (3) Pressure to engage in falsification, embezzlement, and bribery.
 - (4) Pressure to issue misleading or incomplete reports.
- 14. A pricing decision must include all costs associated with the product. The manufacturing product cost as well as all upstream costs (costs that occur before the manufacturing process begins, e.g., research and development costs) and downstream costs (costs that are incurred after the manufacturing process, e.g., sales commissions) must be covered by the product's revenues in order for the company to be profitable.
- 15. JIT inventory system is a reengineering principle where inventory is made available for customer consumption at the time of customer demand. A JIT inventory system is designed to eliminate the storage of large amounts of inventory. By eliminating the storage of inventory, costs related to inventory such as financing, warehouse space, security and maintenance, theft, damage and obsolescence can be reduced or eliminated.
- 16. Reengineering is the term used to explain companies' responses to world-wide competition by changing production and delivery systems so as to eliminate waste, reduce errors, and minimize costs. Some of the best practices used by world-class competitors include activity-based management, value-added activities, and just-in-time inventory acquisition.

- 17. In traditional costing systems, indirect costs are assigned to products, services, or customers using some allocation base measured in volume such as direct labor hours. In activity-based costing a different allocation system is used to improve the accuracy of allocations. With activity-based costing, indirect costs are first assigned to organizational activities and then to products, services, or customers based on their use of that activity. There is usually a two-level allocation process and more than one allocation base may be used.
- 18. A value chain is the sequence of activities through which an organization provides products to its customers.
- 19. A value-added activity is any unit of work that contributes to a product's ability to satisfy customer needs. Value-added activities include the following:
 - (1) Input activities research and development, product design, and hiring and training.
 - (2) **Processing activities assembly, inspection, and storing.**
 - (3) Output activities marketing, distribution, and customer relations.
 - (4) Administrative activities accounting and legal services, personnel management, and public relations.

Nonvalue-added activities are tasks undertaken that do not contribute to a product's ability to satisfy customer needs. Examples would include the following:

- (1) Maintaining excess quantities of inventories.
- (2) Transporting materials and products during production and storage stages.
- (3) Machine set-ups.

2.	NA	I	D	NA	NA	NA	NA	NA	NA

Exercise 1-9A

- a. The three main components of product cost for a manufacturing entity are direct materials, direct labor, and manufacturing overhead.
- b. The product cost in a merchandising company, such as a retail toy store, is relatively easy to determine. It includes vendor's price charged on the invoice, freight cost, and other necessary costs to make the inventory available for sale. Measuringproduct cost for a manufacturing entity, though, requires a morecomplex system. First of all, the manufacturing firm has to classify its costs between product costs and period costs. The firm has to accumulate product costs such as direct materials, direct labor, and manufacturing overhead. Once the product costs have been accumulated, the firm has to classify the cost of a product that has been sold as expense, and the cost of an unsold product as inventory, an asset.
- c. If each product is given a fixed amount of space for display, it is possible to use the percentage of space occupied by each product to allocate the rental cost. However, the cost of measuring the square footage occupied by each product may be so high that it outweighs the benefit of generating more accurate information.

The wages paid to workers who restock the shelves regularly cannot be allocated to individual products easily because the number of products handled by workers is huge and the time spent on each product often fluctuates according to changing market conditions.

The salary of the store manager cannot be allocated to individual products easily, either. The manager oversees the overall store operation including product stocking decisions, hiring, and pricing. Exercise 1-10

a. Payroll costs that would be classified as selling, general, and administrative expense include the following:

Salary of the company president	\$ 40,00
Salary of the chief financial officer	20,00
Salary of the vice president of marketing	18,00
Salaries of administrative secretaries	60,00
Commissions paid to sales staff	252,00
Total	\$390,00

b. Payroll costs that would be classified as product cost include the following:

Salary of the vice president of manufacturing	\$ 25,00
Salary of middle managers in manufacturing plant	196,00
Wages of production workers	938,00
Salaries of engineers and maintenance crew	<u>178,00</u>
Total	\$1,337,00

Since 3,600 units of 4,000 finished products were sold, 90% (*i.e.* $3,600 \div 4,000$) of the product cost would be classified as cost of goods sold. Therefore, the payroll cost that would be included in cost of goods sold is determined as follows:

\$1,337,000 x 90% = \$1,203,300

Alternatrive computation for the same result follows :

(\$1,337,000 ÷ 4,000) X 3,600 = \$1,203,300

Exercise 1-8A

	Assets							=	Eq	<i>ju</i>	ity	Inco	me S	ta	tement

Exercise 1-9A

а.

Raw materials purchased and used	\$ 4,70
Wages of production workers	5,10
Depreciation on manufacturing equipment	3,80
Total product cost	\$13,60

b.

Cost of inventory per unit = \$13,600 ÷ 2,000 = \$6.80

Ending inventory in units = 2,000 - 1,650 = 350

Cost of ending inventory = \$6.80 x 350= \$2,380

C.

Cost of goods sold = \$6.80 x 1,650 = \$11,220

Exercise 1-10A

- a. Event No. 1 represents the depreciation on the computers because no product inventory exists in a service organization. The cost of depreciation, thus, must be expensed.
- b. The computers in a service organization must be expensed as explained in *Part a*. This transaction decreases the asset equipment and retained earnings, both balance sheet accounts. The transaction increases expense on the income statement.

The depreciation on production equipment in a manufacturing company decreases the equipment account and increases the inventory account. It does not affect the income statement until the product is completed and sold.

Exercise 1-11A

	Net Income
	Amount of
Event No.	Change
1. Adjusting entry	(\$5,000)
2. Adjusting entry	NA
3. Adjusting entry	(\$8,000)
4. Adjusting entry	NA
5. Adjusting entry	(\$1,600)
6. Adjusting entry	NA

Exercise 1-12A

- a. The \$67,000,000 of research and development cost is an upstream cost while packaging, shipping, and sales commissions are downstream costs.
- b. Cost of goods sold: \$250 x 400,000 = \$100,000,000 Ending inventory: \$250 x 40,000 = \$10,000,000

Upstream cost per unit, \$67,000,000 ÷ 2,000,000	\$ 33.50
Manufacturing cost per unit	250.00
Downstream costs per unit	<u>50.00</u>
Total cost	333.50
Plus: 25% profit margin, \$333.50 x 25%	<u>83.38*</u>
Price	\$416.88

*Rounded

d.

C.

Income Statement	
Sales revenue (\$416.88 X 400,000)	\$ 166,752,00
Cost of goods sold	(100,000,00
Gross margin	66,752,00
Research and development	(67,000,00
Selling expenses (\$50 x 400,000)	(20,000,00
Net income (Loss)	\$ (20,248,00
	-

e. The upstream cost of research and development is required by GAAP to be expensed in the period that it is incurred. However, the R&D is expected to result in overall sales of 2,000,000 units. The income statement for 2014 includes the sales of only 400,000 units while recognizing the entire cost of R&D as expense. In other words, the net loss is only temporary and a result of timing difference.

Exercise 1-13A

If Mallett has effectively implemented a 100% just-in-time inventory system, the company can sell products without maintaining any inventory on hand. This is true if Mallett instructs its suppliers to ship products directly to Mallett's customers when Mallett receives customer orders.

Exercise 1-14A

a.

Income Statement Sales revenue (\$15 x 725)	\$ 10,8 [°]
Cost of goods sold (\$7 x 725)	¢ ۲0,0 (5,07
Gross margin	5,80
Waste due to excess inventory (\$7 x 75)	(525)
Net income	\$ 5,2

b.

Income Statement	
Sales revenue (\$15 x 800)	\$12,00
Cost of goods sold (\$7 x 800)	(5,60
Net income	\$ 6,40

The opportunity cost of lost profit: $(\$15 - \$7) \times 25 = \$200$

c. If Ms. Connor can arrange an effective JIT system, the T-shirts would be delivered by the supplier just in time for customers to purchase. To give an example of such a system, assume that the supplier sets up a simple T-shirt printing facility at Meadow School. The supplier could bring in enough generic T-shirts. When a customer wants to buy a T-shirt from Kate Connor, the supplier could print the school's special art design on a generic T-shirt and deliver the T-shirt to Ms. Connor. In this JIT design, Ms. Connor would not have to carry any inventory. The supplier would keep only generic product as inventory, which could be sold in other events.

If an effective JIT system is implemented, Ms. Connor would not have to keep any inventory, and thus, would avoid the loss due to excessive inventory. Ms. Connor would be able to meet all customer demand because the supplier could deliver whatever quantity of product that Ms. Connor's customers demand. Therefore, Ms. Connor could avoid the opportunity cost due to lostsales. Exercise 1-15A

- a. The new inventory system is an approximate just-in-time system since it does not eliminate all inventory.
- b. Reduced cost of inventory: \$46,000 \$4,000 = \$42,000

Finance cost: \$42,000 x 8% = \$3,360

Total eliminated inventory holding cost: \$3,360 + \$5,600 = \$8,960

Exercise 1-16A

a. While the entire \$840,000 of transportation cost should have been expensed immediately, the CFO put the \$840,000 into an inventory account. Since some of the inventory was not sold, some of the transportation cost is still in the inventory account. The computations are shown below:

Misclassified cost per unit = $\frac{\$840,000}{20,000}$ = \$42 per microscope

Number of units in ending inventory:

Inventory Completed	20,000
Less Inventory Sold	<u>(14.000)</u>
Ending Inventory	6,000

The portion of transportation cost still in ending inventory is \$252,000 (\$42 x 6,000 units).

Instead of being in the inventory account, the \$252,000 should have been expensed. As a result, assets, retained earnings (equity), and net income are overstated by \$252,000. Expenses are understated by the same amount. Revenue and liabilities are not affected.

b. The maximum penalty for an intentional misrepresentation is punishable by a fine of up to \$5 million and imprisonment of up to 20 years.

Exercise 1-17A

The CFO and controller violated the Statement of Ethical Professional Practice on two major items: integrity and objectivity. Regarding integrity, the officers' personal interests conflicted with the public interest because the officers reaped a bonus that they didn't deserve. Moreover, their actions certainly discredited the accounting profession. Regarding objectivity, the officers didn't communicate information fairly and objectively.

Exercise 1-18A

The process of shipping the encased speakers back to Audiomax Company by Serle Cabinet, Inc. is nonvalue-added. This process can be eliminated if Serle ships the product to Audiomax's customers directly.

Problem 1-19A

The following horizontal financial statements model is not required in the problem. It is provided to show the process of computation.

	ent Assets			= Equity				Income Statement

Problem 1-21A

Bailey Company									
Income Statement for	2015	Balance Sheet as of 12/31/2015							
Sales revenue	\$7,875	Assets							
Cost of goods sold ¹	(5,400)	Cash ³	\$8,125						
Gross margin	2,475	Fin. goods inventory ¹	600						
Administrative expense ²	(750)	Total assets	\$8,725						
Net income	1,725								
		Equity							
		Common stock	\$7,000						
		Retained earnings	1,725						
		Total equity	\$8,725						

- ¹ The product costs include \$2,800 for materials, \$1,900 for labor, and \$1,300 for overhead. Accordingly, \$6,000 (*i.e.*, \$2,800 + \$1,900 + \$1,300) was used to make the 500 units of product. The cost per unit is \$12.00 (*i.e.* \$6,000 \div 500 units). Since 450 units were sold, ending inventory will be composed of 50 units (*i.e.* 500 units 450 units). The amount of cost of goods sold is \$5,400 (*i.e.*, \$12.00 x 450 units). The balance in ending inventory would be \$600 (*i.e.*, \$12.00 x 50 units).
- ² Administrative expenses are composed of \$350 administrative salaries + \$400 administrative rent = \$750.
- ³ Cash balance: \$7,000 \$2,800 \$1,900 \$1,300 \$350 \$400 + \$7,875 = \$8,125.

a.

u.			
	Lang Co	ompany	
Income Statement for	or 2014	Balance Sheet as of	12/31/2014
Sales revenue	\$95,000	Assets	
Operating expenses ¹	(75,000)	Cash ²	\$84,000
Net income (Loss)	\$20,000	Total assets	\$84,000
		Equity	
		Common stock	\$64,000
		Retained earnings	20,000
		Total equity	\$84,000
	_		

¹ The entire \$75,000 expenditure is a period cost that is recognized as an expense.

² The cash balance will be the same for all three scenarios. The company acquires \$64,000 of capital, earns \$95,000 sales revenue and spends \$75,000, thereby leaving an \$84,000 ending balance. Do not be confused by the fact that the \$75,000 is used to pay for different things under the alternative scenarios. The cash outflow is always \$75,000 regardless of what is bought.

b.

	ompany
Income Statement for 2014	Balance Sheet as of 12/31/2014
Sales revenue \$95,000	Assets
Depreciation exp. ¹ (15,000)	Cash \$ 84,000
Net income \$80,000	Rental equipment 75,000
	Accumulated dep. ¹ (15,000)
	Total assets \$144,000
	Equity
	Common Stock \$ 64,000
	Retained earnings <u>80,000</u>
	Total equity \$144,000

¹ The \$75,000 was used to purchase automobiles that had 5-year useful lives with no salvage value. The depreciation charge is \$15,000 [*i.e.*, (\$75,000 - 0) ÷ 5 years]. Since the solution applies to the first year of operation, the amount in the accumulated depreciation account and the amount in depreciation expense are equal.

Problem 1-22A (continued)

_	
	-
-	-

	Lang Con	npany	
Income Stateme	nt for 2014	Balance Sheet as of 1	2/31/2014
Sales revenue	\$95,000	Assets	
Cost of goods sold ¹	<u>(33,000)</u> Gross	Cash	\$ 84,000
margin	62,000	Finished goods inv.	11,000
Administrative expen	nse² <u>(5,000)</u> Ne	Mfg. equipment	36,000
income	\$57,000	Accumulated dep. ¹	(10,000)
		Total assets	\$121,000
		-	
		E	
		Equity	
		Common stock	\$64,000
		Retained earnings	57,000
		Total equity	\$121,000
		• •	

¹ The product costs are \$12,000 for materials, \$22,000 for labor, and \$10,000 for overhead. The overhead cost results from depreciation on the manufacturing equipment [*i.e.*, (\$36,000 cost - \$6,000 salvage) ÷ 3 year life]. Accordingly, total product costs amount to \$44,000 (*i.e.*,

\$12,000+\$22,000+\$10,000). The cost per unit is \$22 (*i.e.*, \$44,000 \div 2,000 units). Since 1,500 units were sold, ending inventory will be composed of 500 units (*i.e.*, 2,000 units - 1,500 units). The amount of cost of goods sold is \$33,000 (*i.e.*, \$22 x 1,500 units). The balance in ending inventory would be \$11,000 (*i.e.*, \$22 x 500 units).

² Salaries of sales and administrative employees

d. It is highly unlikely that Lang can determine the exact cost of any particular unit of product. Materials and labor usage will differ slightly between units of the same product. Cost averaging smoothes these differences across units of the same product.

Problem 1-23A

a. Option No. 1

Naok Income Stateme		ing Company Balance Sh	leet
Sales revenue	\$90,000		
Cost of goods sold ¹	(22,500)	Cash	\$ 86,000
Gross margin	67,500	Finished goods inv. ²	7,500
Sell., gen., & adm. exp.	(24,000)	Total assets	\$93,500
Net income	\$43,500		
	. ,		
			_
		Equity	
		Common stock	\$50,000
		Retained earnings	<u>43,500</u>
		Total equity	\$93,500

¹\$30,000 (Total product cost) ÷ 4,000 = \$7.50 per unit. \$7.50 x 3,000 = \$22,500.

²Inventory: \$7.50 x 1,000 = \$7,500.

Problem 1-23A (continued)

a. Option 2

Naoki Income Stateme		ing Company Balance Shee	t
Sales revenue	\$90,000	Assets	
Cost of goods sold ¹	(40,500)	Cash	\$ 86,000
Gross margin	49,500	Finished goods inv. ²	13,500
Sell., gen., & adm. exp.	<u> </u>	Total assets	\$99,500
Net income	\$49,500		
		Equity	
		Common Stock	\$50,000
		Retained earnings	49,500
		Total equity	\$99,500
			ψ33,300

¹Total product cost: 30,000 + 24,000 = 54,000. Product cost per unit: \$54,000 ÷ 4,000 = \$13.50 Cost of goods sold: \$13.50 x 3,000 = \$40,500.

²Inventory: \$13.50 x 1,000 = \$13,500.

Problem 1-23A (continued)

- b. Option No. 2 results in financial statements that are more likely to leave a favorable impression on investors and creditors because the net income under option No. 2 is \$6,000 greater than that under option No. 1.
- c. President's bonus under option No. 1: \$43,500 x 25% = \$10,875 President's bonus under option No. 2: \$49,500 x 25% = \$12,375

Option No. 2 provides the president with a higher bonus.

d. Income tax expense under option No. 1: \$43,500 x 35% = \$15,225

> Income tax expense under option No. 2: \$49,500 x 35% = \$17,325

Option No. 1 minimizes the amount of the company's income tax expense.

e. Option No. 2 provides the president with a higher bonus. However, option No. 1 minimizes the amount of the company's income tax expense. As a result, these two options reveal a conflict of interest between the company and its president. To avoid the conflict of interest, the company can offer a bonus plan that is tied to the company's stock price instead of net income on financial statements. To the extent that the market is efficient, it will reward performance that adds value to a company by bidding up the company's stock price. An efficient market is not deceived by accounting policies that are designed solely to manipulate financial statements.

Problem 1-24A

- a. Annual inventory holding cost: (\$2,000,000 x 10%) + (\$9,000 x 12) = \$308,000
- b. A JIT system should enable Torre to receive raw materials just in time for production. Therefore, it virtually eliminates the need to hold inventory. The inventory holding cost can be eliminated as well.
- c. Establishing a most-favored customer status with reliable suppliers could assure a steady supply of raw materials even when shortages exist for other customers. Such assurance can almost eliminate the need for maintaining raw material inventories.

Problem 1-25A

a. 95 students enroll in the course:

Revenue (\$1,500 x 95)		\$142,500
Expenses		
Cost of textbooks (\$80 x 110)	\$ 8,800	
Cost of teachers	36,000	
Other operating expenses	40,000	
Total expenses		84,800
Net income	_	\$ 57,700

Cost of unused books: [(110 – 95) x \$80] = \$1,200.

b. 115 students attempt to register, but only 110 students can be accepted:

Revenue (\$1,500 x 110)		\$165,000
Expenses		
Cost of textbooks (\$80 x 110)	\$ 8,800	
Cost of teachers	36,000	
Other operating expenses	40,000	
Total expenses		84,800
Net income	-	\$ 80,200

Problem 1-25A (continued)

If all 115 students could be accepted, the income statement would be as follows:

Revenue (\$1,500 x 115)		\$172,500
Expenses		
Cost of textbooks (\$80 x 115)	\$ 9,200	
Cost of teachers	36,000	
Other operating expenses	40,000	
Total expenses		85,200
Net income	-	\$ 87,300

The lost profit resulting from rejecting 5 additional students is \$7,100 (\$87,300 – \$80,200).

c. 95 students enrolled under a JIT system:

Revenue (\$1,500 x 95)		\$142,500
Expenses		
Cost of textbooks (\$90 x 95)	\$ 8,550	
Cost of teachers	36,000	
Other operating expenses	40,000	
Total expenses		84,550
Net income	_	\$ 57,950

The savings from eliminating the cost of excessive books exceeds the increased cost for the required number of books. Therefore, the total expenses using the JIT system are less than those under the traditional inventory system in *requirement a*. Since the revenues are the same, the JIT system results in a greater net income than the traditional system.

Problem 1-25A (continued)

d. 115 students enrolled under the JIT system

Revenue (\$1,500 x 115)		\$172,500
Expenses		
Cost of textbooks (\$90 x 115)	\$10,350	
Cost of teacher	36,000	
Other operating expenses	40,000	
Total expenses		86,350
Net income	-	\$ 86,150

The additional revenue from 5 students who would have been turned away under the condition of *requirement b* exceeds the additional cost of books required under the JIT system. Therefore, the JIT system results in a greater net income than the traditional system.

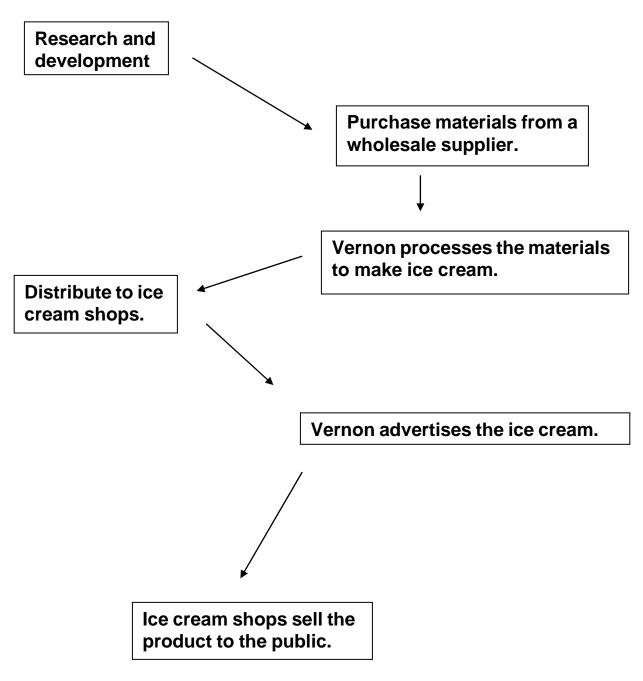

e. Students who are denied enrollment may develop a negative image of CMA Review, Inc. The negative image could become widespread when the disgruntled students complain to their friends. The JIT system not only improves net income, but improves customer satisfaction by allowing everyone entry into the course.

Problem 1-26A

- a. (1) Separation of duties Jason exercised control over both purchasing and receiving functions. (2) Failure to force extended absences Jason was always around. He never took vacations. Indeed, the embezzlement was discovered when Jason was in the hospital. It may have been discovered much earlier had Jason been required to take vacations. (3) Lack of prenumbered documents. The extent of the embezzlement could have been more easily determined had the purchase order forms been prenumbered. (4) Lack of physical control The accounting records should have been kept under lock and key thereby preventing Jason from stealing and destroying the documents.
- b. (1) Opportunity Lack of internal controls described in the answer to part a. (2) Pressure Jason had a fanatical desire to help the underprivileged children. (3) Rationalization Jason had convinced himself that the good he was doing to help the children justified the wrong he was doing by embezzling from the company. Doing the wrong thing for the right reasons does not justify the wrong doing.

Problem 1-27A

a. Value Chain

 b. Vernon's competitors engage in activities similar to Vernon's for materials acquisition, product manufacturing, product distribution, and advertising. The value-added activity that Vernon has created is its research and development effort, which resulted in a new product for consumers.

Exercise 1-6B

- a. The three components of product cost incurred in producing cakes are direct materials such as flour, sugar, and eggs; direct labor such as Ann's effort to mix ingredients together and bake them into cakes; and manufacturing overhead such as the cost of an oven, electric power cost, and the cost of detergent to wash pans.
- b. Measuring product cost for a merchandising company, such as a retail store, is relatively easy. It includes the vendor's invoice price, freight cost, and other costs necessary to get the inventory ready to sell. Measuring product cost for a manufacturing entity requires a more complex system. A manufacturing enterprise must classify its costs as product costs or period costs. It must accumulate product costs (direct materials, direct labor, and manufacturing overhead). It must then classify the cost of sold products as expense and unsold products as inventory, an asset.
- c. If Ann produced only one type of cake, she could possibly use the number of cakes baked per month to allocate an equal portion of her utility cost increase to each cake. Since Ann's cakes are custom-made for individual customers, however, they vary in size, shape, and ingredients. They bake for different lengths of time at different temperatures. Further, their refrigeration requirements differ. There is no cost-effective way to measure the amount of electricity used by individual cakes. Consequently, utility cost must be treated as a manufacturing overhead cost.

The cost of an oven is a component of product cost which is difficult to measure. The useful life is uncertain, as is the number of cakes Ann may bake over its lifetime. It is impossible to trace the amount of oven depreciation to the cost of an individual cake. Other difficult-to-measure costs include the costs of detergent, water, heating, and air conditioning to provide a pleasant kitchen in which Ann can work. These costs cannot easily be traced to individual cakes.

Exercise 1-7B

a. Depreciation costs that would be classified as selling, general, and administrative expense are the following:

Depreciation of a building for finished product display	\$ 9,60
Depreciation of delivery trucks	18,00
Depreciation of furniture used in the president's office	7,50
Depreciation of elevators in administrative buildings	12,00
Total	\$47,10

b. Depreciation costs that would be classified as product costs are the following:

Depreciation of factory buildings	\$ 36,00
Depreciation of computers used in manufacturing	5,00
Depreciation of forklifts used in the factory	30,00
Depreciation of factory machinery	31,00
Total	\$ 102,00

Since 2,000 units of 3,000 products finished were sold, 2/3 (2,000 \div 3,000) of the product cost would be included in cost of goods sold. Therefore, the total depreciation cost that would be included in cost of goods sold is:

\$102,000 x 2/3 = \$68,000

Exercise 1-8B

Exercise 1-9B

Raw materials purchased and used	\$ 7,80
Wages of production workers	6,00
Depreciation on manufacturing equipment	2,50
Total product cost	\$16,30

b.

Cost of inventory per unit = \$16,300 ÷ 5,000 = \$3.26

Ending inventory in units = 5,000 - 4,600 = 400

Cost of ending inventory = \$3.26 x 400 = \$1,304

C.

Cost of goods sold = \$3.26 x 4,600 = \$14,996

Exercise 1-10B

- a. Event No. 1 represents the expiration of insurance on a factory building because the recognition decreases prepaid insurance and increases inventory, both assets on the balance sheet. The expiration of insurance on a factory building does not affect the income statement until the products made in the factory are sold.
- b. The cost of insuring a factory is among the costs necessary to produce inventory. The expiration of factory insurance, therefore, is an asset exchange: the asset prepaid insurance is exchanged for the asset inventory, affecting only the balance sheet. The expiration of insurance on an administrative building, however, is an asset use transaction which increases expense on the income statement. No asset that will benefit future periods is produced in the administrative building.

Exercise 1-11B

Exercise 1-12B

C.

- a. The \$35,000,000 of research and development costs is an upstream cost. Packaging, shipping, and sales commissions are downstream costs.
- b. Cost of goods sold: \$20 x 600,000 = \$12,000,000 Ending inventory: \$20 x 200,000 = \$4,000,000

Upstream cost per unit, \$35,000,000 ÷ 5,000,000	\$7
• • • • • • •	÷ -
Manufacturing cost per unit	20
Downstream costs per unit	3
Total cost	30
Plus: 40% profit margin, \$30 x 40%	<u> 12</u>
Price	\$42

Exercise 1-12B (continued)

d.

Income Statement	
Sales revenue (\$42 X 600,000)	\$ 25,200,00
Cost of goods sold (\$30 X 600,000)	(18,000,00
Gross margin	7,200,00
Research and development expense	(35,000,00
Selling expenses (\$3 x 600,000)	(1,800,00
Net income (Loss)	(\$29,600,00
	-

e. GAAP requires expensing research and development costs in the period in which they are incurred. However, Safin expects the R&D costs to result in overall Allergone sales of 5,000,000 units in 2014 andfuture years. The income statement for 2014 recognizes revenue fromselling 600,000 units while recognizing the entire R&D cost as expense. No R&D cost will be recognized on future income statements. The 2014 net loss will be more than offset by positive net incomes from future Allergone sales.

Exercise 1-13B

Increases in inventory without corresponding increases in sales revenue often signal increasing working capital costs and a decreasing rate of cash inflows. More cash has been invested in inventory, but the inventory has not been sold and therefore converted back into cash. With a just-in-time inventory management system (JIT system), Baxter would only acquire inventory when it is needed for sale, eliminating its costly investment in idle inventory and speeding up its cash flow.

Exercise 1-14B

a.

Income Statement	
Sales revenue (\$25 x 1,150)	\$28,7
Cost of goods sold (\$17 x 1,150)	(19,55
Gross margin	9,20
Waste due to excess inventory (\$17 x 100)	(1,70
Net income	\$ 7,50

b.

Income Statement	
Sales revenue (\$25 x 1,250)	\$31,25
Cost of goods sold (\$17 x 1,250)	(21,25
Net income	\$10,00
	<i><i></i></i> <i></i>

The opportunity cost of lost sales: (\$25 – \$17) x 150 = \$1,200

c. If Erica could arrange to order only the number of yearbooks actually needed, the school could eliminate potential losses from either the waste attributable to unsold yearbooks or the opportunitycost of lost sales from having too few yearbooks available. For example, the yearbook staff could request that students, faculty members, and staff members who want to purchase yearbooks complete order forms 10 days in advance of the school fair day. Onthat day, the yearbook staff could set up a yearbook stand to receivecustomer payments and deliver yearbooks at the same time. Exercise 1-15B

- a. The new inventory system is an approximate just-in-time system since it does not eliminate all inventory.
- b. Reduced cost of inventory: \$12,000 \$2,000 = \$10,000

Finance cost: \$10,000 x 9% = \$900

Total eliminated inventory holding cost: \$5,000 + \$900 = \$5,900

Exercise 1-16B

a. While the entire \$1,500,000 of upstream research and development cost should have been expensed immediately, the CFO put the \$1,500,000 into an inventory account. Since some of the inventory was not sold, some of the R&D cost is still in the inventory account. The computations are shown below:

Misclassified cost per unit = $\frac{$1,500,000}{5,000}$ = \$300 per unit

Number of units in ending inventory:

Inventory Completed	5,000
Less Inventory Sold	(4.000)
Ending Inventory	1,000

The portion of R&D cost still in ending inventory is \$300,000 (\$300 x 1,000 units).

Instead of being in the inventory account, the \$300,000 should have been expensed. As a result, assets, retained earnings (equity), and net income are overstated by \$300,000. Expenses are understated by the same amount. Revenue and liabilities are not affected.

b. The CFO's motive was probably that he was under pressure to present an inflated amount of net income. Executive compensation is frequently tied to net income or stock price which is related by net income. Further, a strong balance sheet and income statement make borrowing money or selling stock easier, because the company appears more attractive to a potential lender or investor.

Exercise 1-17B

Had the Sarbanes-Oxley Act been in effect, HealthSouth would have been required to establish a hotline and other mechanisms for the anonymous reporting of fraudulent activities. The company also would have been prohibited from applying any form of punishment to whistleblowers such as Greg Madrid.

Exercise 1-18B

The process of shampooing a customer's hair before cutting is nonvalueadded if the customer's hair isn't dirty. The barber could change shop policy to offer a reduced price haircut to customers who have just washed their hair before coming to the barbershop.

Problem 1-19B

The following horizontal financial statements model is not required in the problem. It is provided to show the process of computation.

Event			As	se	ts			=	Equ	ity		Ir	CO	me State	eme	ent

Problem 1-21B

	Tanjin Co	ompany	
Income Statement for	2015	Balance Sheet as of 12/	31/2015
Sales revenue	\$29,700	Assets	
Cost of goods sold ¹	(22,000)	Cash ³	\$64,700
Gross margin	7,700	Fin. goods inventory ¹	2,000
Administrative expense ²	<u>(5,000)</u>	Total assets	\$66,700
Net income	\$2,700		
		Equity	
		Common stock	\$64,000
		Retained earnings	2,700
		Total equity	\$66,700

¹ The product costs are \$10,500 for materials, 8,600 for labor, and \$4,900 for overhead. Accordingly, \$24,000 (*i.e.*, \$10,500 + \$8,600 + \$4,900) was used to make the 1,200 units of product. The cost per unit is \$20 (*i.e.*)

 $24,000 \div 1,200$ units). Since 1,100 units were sold, ending inventory willbe composed of 100 units (*i.e.* 1,200 units - 1,100 units). The amount of cost of goods sold is 22,000 (*i.e.*, $20 \times 1,100$ units). The balance in ending inventory would be 2,000 (*i.e.*, 20×100 units).

- ² Administrative expenses are composed of \$2,100 administrative salaries + \$2,900 administrative rent = \$5,000.
- ³ Cash balance: 64,000 10,500 8,600 4,900 2,100 2,900 + 29,700 = 64,700.

Problem 1-22B

a.

<u>ui</u>			
	Financial St Weldon C		
Income Statem	ent	Balance S	heet
Sales revenue	\$75,000	Assets	
Operating expenses ¹	<u>(84,000)</u>	Cash ²	<u>\$77,000</u>
Net loss	\$ (9,000)	Total assets	\$77,000
		Equity	
		Common stock	\$86,000
		Retained earnings	(9,000)
		Total equity	\$77,000

¹ The entire \$84,000 expenditure is an administrative cost that is recognized as an expense.

² The cash balance will be the same for all three scenarios. The company acquires \$86,000 of capital, earns sales revenue of \$75,000 and spends \$84,000 thereby leaving a \$77,000 ending balance. Do not be confused by the fact that the \$84,000 is used to pay for different things under the alternative scenarios. The cash outflow is always \$84,000 regardless of what is bought.

Problem 1-22B (continued)

b.

			Statements Company	
	Income Staten	nent	Balance Sho	eet
	Sales revenue	\$75,000	Assets	
	Depreciation exp. ¹	<u>(16,800)</u>	Cash	\$ 77,000
I	Net income	\$58,200	Trucks	84,000
	-		Accumulated dep. ¹	<u>(16,800)</u>
ĺ			Total assets	\$144,200
ĺ				
I			Equity	
			Common stock	\$ 86,000
			Retained earnings	<u>58,200</u>
			Total equity	\$144,200

¹ The\$84,000 was used to purchase trucks that had a zero salvage value and 5-year useful lives. The depreciation charge is \$16,800 [*i.e.*, (\$84,000 - 0) ÷ 5 years]. Since the solution applies to the first year of operation the amount in the accumulated depreciation account and the amount in depreciation expense are equal.

Problem 1-22B (continued)

С.			
Financial Statements			
Weldon Company			
Income Stateme		Balance She	et
Sales revenue	\$75,000	Assets	
Cost of goods Sold ¹	(40,000)	Cash	\$77,000
Gross margin	35,000	Finished goods inv. ¹	6,000
Administrative expense ²	(4,000)	Mfg. equipment	40,000
Net income	\$31,000	Accumulated dep. ¹	(6,000)
		Total assets	\$117,000
			_
		Equity	
		Common stock	\$86,000
		Retained earnings	31,000
		Total equity	\$117,000

¹ The product costs are \$16,000 for materials, \$24,000 for labor, and \$6,000 for overhead. The overhead cost results from depreciation on the manufacturing equipment [*i.e.*, (\$40,000 cost - \$4,000 salvage) ÷ 6 year life]. Accordingly, \$46,000 (*i.e.*, \$16,000+\$24,000+\$6,000) was used to make the 2,300 units of product. The cost per unit is \$20 (*i.e.*, \$46,000 ÷ 2,300 units). Since 2,000 units were sold, ending inventory will be composed of 300 units (*i.e.*, 2,300 units - 2,000 units). The amount of cost of goods sold is \$40,000 (*i.e.*, \$20 x 2,000 units). The balance in ending inventory would be \$6,000 (*i.e.*, \$20 x 300 units).

² Salaries of sales and administrative employees.

d. It is highly unlikely that Weldon can determine the exact cost of any particular unit of product. Materials and labor usage will differ slightly between product units. Cost averaging smoothes these differences across units of product.

Problem 1-23B

a. Option No. 1

	Financial St	atements	
	Haas Cor	npany	
Income Statem	ent	Balance Shee	et
Sales revenue	\$120,000	Assets	
Cost of goods sold ¹	(48,000)	Cash	\$121,000
Gross margin	72,000	Finished goods inv. ²	12,000
Gen., sell., & adm. exp.	(25,000)	Total assets	\$133,000
Net income	\$47,000	-	
		Equity	
		Common stock	\$ 86,000
		Retained earnings	47,000
		Total equity	\$133,000

¹\$60,000 (Total product cost) \div 10,000 = \$6 per unit. \$6 * 8,000 = \$48,000. ²\$6 X 2,000 = \$12,000.

a. Option 2

Income Statem	ent	Balance S	heet
Sales revenue	\$120,000	Assets	
Cost of goods sold ¹	<u>(68,000)</u>	Cash	\$121,000
Gross margin	52,000	Finished goods inv. ²	<u>17,000</u> Total
Gen., sell., & adm. exp.	<u> </u>	assets	\$138,000
Net income	\$52,000		
		Equity	
		Common stock	\$ 86,000
		Retained earnings	52,000Total
		equity	\$138,000

¹Total product cost: \$60,000 + \$25,000 = \$85,000. Product cost per unit: \$85,000 ÷ 10,000 = \$8.50 Cost of goods sold: \$8.50 x 8,000 = \$68,000.

²Inventory: \$8.50 X 2,000 = \$17,000.

Problem 1-23B (continued)

- b. Option No. 2 results in financial statements that are more likely to leave a favorable impression on investors and creditors because the net income under option No. 2 is \$5,000 greater than that under option No. 1.
- c. President's bonus under option No. 1: \$47,000 x 10% = \$4,700

President's bonus under option No. 2: \$52,000 x 10% = \$5,200

Option No. 2 provides the president with a higher bonus.

d. Income tax expense under option No. 1: \$47,000 x 35% = \$16,450

> Income tax expense under option No. 2: \$52,000 x 35% = \$18,200

Option No. 1 minimizes the amount of the company's income tax expense.

e. Option No. 2 provides the president with a higher bonus. However, option No. 1 minimizes the amount of the company's income tax expense. As a result, these two options reveal a conflict of interest between the company and its president. To avoid the conflict of interest, the company can offer a bonus plan that is tied to the company's stock price instead of net income on financial statements. To the extent that the market is efficient, it will reward performance that adds value to a company by bidding up the company's stock price. An efficient market is not deceived by accounting policies that are designed solely to manipulate financial statements.

Problem 1-24B

- a. Annual inventory holding cost: (\$500,000 x 12%) + \$80,000 = \$140,000
- b. Shamoon uses a JIT system. Shamoon acquires automobiles only when it has received customer orders. Therefore, Shamoon does not hold inventory. Without the associated inventory holding cost, Shamoon can afford to offer reduced prices to its customers.

Problem 1-25B

a. 160 hamburgers are sold:

Revenue (160 x \$4.50)	\$720
Cost of hamburgers (200 x \$1.05)	<u>(210)</u>
Gross margin	510
Selling, general, & administrative expenses	<u>(100)</u>
Net income	\$410

Cost of wasted hamburgers: [(200 – 160) x \$1.05] = \$42.

b. 240 customers attempt to buy hamburgers but 40 of them must be turned away:

Revenue (200 x \$4.50)	\$900
Cost of hamburgers (200 x \$1.05)	(210)
Gross margin	690
Selling, general, & administrative expenses	(100)
Net income	\$590

Had Jack's prepared 240 hamburgers in advance, it could have made more profit:

Revenue (240 x \$4.50)	\$1,080
Cost of hamburgers (240 x \$1.05)	(252)
Gross margin	828
Selling, general, & administrative expenses	(100)
Net income	\$728

The lost profit resulting from insufficient supply is \$90 per day (728 - 590 = 138, or \$3.45 x 40 = \$138).

Problem 1-25B (continued)

c. 160 hamburgers are sold under the JIT system:

Revenue (160 x \$4.50)	\$720
Cost of hamburgers (160 x \$1.05)	(168)
Gross margin	552
Selling, general, & administrative expenses	(120)
Net income	\$432

Under the JIT system, the cost of excessive hamburgers can be eliminated. The reduction of hamburger cost exceeds the increase of employee payroll cost. As a result, the net income increases by \$22, as compared to the net income under the original inventory system.

d. 240 hamburgers are sold under the JIT system:

Revenue (240 x \$4.50)	\$1,080
Cost of hamburgers (240 x 1.05)	(252)
Gross margin	828
Selling, general, & administrative expenses	<u>(120)</u>
Net income	\$708

Under the JIT system, additional customer orders can be accepted. The additional revenue exceeds the additional employee payroll cost. Therefore, the net income increases by \$118, as compared to that under the original inventory system.

e. The hamburgers prepared under the JIT system are fresher than those prepared hours in advance. Jack's can also prepare hamburgers according to individual customer preferences. Consequently, customer satisfaction will increase. Better customer satisfaction will lead to more customer purchases and higher revenues. As the cost per hamburger remains stable, the higher sales revenue will result in a higher profit. In addition, Jack's can avoid turning excess customers away, which could have a negative impact on its reputation.

Problem 1-26B

- a. Separation of duties failed to prevent the company's fraudulent reporting because collusion in the management team circumvented the control of separating duties.
- b. The entire executive team was under pressure to report inflated earnings because their bonuses depended on it. They rationalized that the fraud could keep the company's stock price high and, thus, was good for both company management and stockholders. Furthermore, they convinced themselves that the company would perform better in the future and the earnings growth would allow them to correct fraudulent revenues they were currently reporting. The opportunity was available because company management had the power to override any internal control design.
- c. The Sarbanes-Oxley act charges the chief executive officer and the chief financial officer with the ultimate responsibility for the accuracy of the company's financial statements and the accompanying notes. An intentional misrepresentation is punishable by a fine of up to \$5 million and imprisonment of up to 20 years. The penalty clause would have served as a strong deterrence against this type of fraudulent reporting.
- d. The CFO violated the Statement of Ethical Professional Practice on two major items: integrity and objectivity. Regarding integrity, the officer's interests conflicted with the company's because the CFO, with other officers, reaped the bonus that he or she didn't deserve. Moreover, their actions certainly discredited the accounting profession. Regarding objectivity, the CFO knowingly allowed unfair information to be communicated.

Problem 1-27B

- a. The value-added activities include the doctor's weighing Ms. Palmer, advising her to lose weight, taking her temperature, taking athroat culture and blood test, prescribing medicine, and advising Ms. Palmer to get bed rest. The nonvalue-added activities include Ms. Palmer's completing the same forms repeatedly, waiting for a long time again and again, answering the accounting clerk's unnecessary questions, and handling the billing error.
- b. Ms. Palmer's personal information should have already been in her patient file when she walked in Dr. Barin's office. To eliminate the unnecessary repetition of completing personal information forms, the receptionist should ask the patient whether his or her personal information has changed since the last visit. If the answer is no, no additional forms should be given to the patient.

The office administrator should maintain a realistic schedule of patient appointments. Tight process control of a realistic schedule can reduce the time that patients must wait.

The patient file should accompany the patient to the accounting office. By consulting the personal information in the file, the accounting clerk would not have to ask the same personal questions that the patient has been asked repeatedly.

If the doctor hires qualified employees, trains them well, and establishes proper accounting controls, billing errors can be reduced or eliminated.

ATC 1-1

- a. The information described in the table is primarily managerial accounting information, as much of it refers to nonfinancial measures. The disclosures are not restricted by GAAP or other regulation. The information about revenues, total assets, and earnings are financial in nature, although they are also useful for managerial accounting purposes.
- b. Other examples of managerial information include operating data such as sales generated per store, number of different products sold, and the revenue generated from each of these. Financial information would include financial statements, footnotes to financial statements, and the auditor's opinion.
- c. Starbucks' 2012 fiscal year appears a better than 2011 because in 2012 it had higher revenues and net earnings.
- d. Starbucks' had more employees and stores in 2012 than in 2011, which suggest it was larger, and therefore, perhaps "better."
- e. It had less square footage of properties used for roasting, warehouse, and distribution activities in 2012 than in 2011. This might suggest it is getting smaller, but in fact, indicates it is getting more efficient since it is selling more goods with fewer facilities.

ATC 1-2

b. Income Statement

\$4,200,000
(2,400,000)
1,800,000
(608,000)
(824,000)
\$ 368,000

ATC 1-3

- a. The company's annual report provides little detail regarding the individual costs incurred to manufacture its products. This annual report, like those of all public companies, is designed primarily to meet the needs of external or internal users.
- b. Snap-on includes shipping and handling costs in cost of goods sold. Therefore, these costs are being treated as a product cost.
- c. Snap-on reports that advertising and promotion costs are "expensed when incurred." Therefore, these costs are being treated as a period cost.
- d. The company reports the balances in three separate inventory accounts: Finished goods, Work in process, and Raw materials.
- e. As of December 31, 2008, the balance in the Land account was \$20.7 million and the balance in Machinery and equipment was \$556.2 million (gross). Accumulated depreciation was not broken down between buildings and improvements, versus machinery and equipment.

ATC 1-4

Each letter prepared by the students will be unique. Accordingly, there is no single solution. However, student letters should include some discussion of at least a few of the following ideas: (1) global competition, (2) benchmarking, (3) value-added assessment, (4) reengineering, and (5) just-in-time inventory systems.

ATC 1-5

- a. Ms. Emerson apparently believes that the number of units produced will be greater than the number of units sold. Under these circumstances, some of the start-up costs would be included in the inventory account on the balance sheet, rather than being recognized as an expense on the income statement. This would increase assets and net income; Ms. Emerson would receive a higher bonus.
- b. As discussed in *part a*, misclassifying the start-up costs would present a more favorable representation of the company's financial condition (i.e., assets and net income are overstated) than actually exists. Accordingly, investors or creditors may be lured into making an investment in or loan to the company that they otherwise would have avoided.
- c. The overstatement of income would result in the overpayment of taxes. This would be detrimental to the owners of the business.
- d. Ms. Emerson has a secret problem (i.e., financing her daughter's education). She engaged in rationalization (i.e., her boss was being unfairly overpaid because of a family relationship with the owner). Finally, Ms. Emerson has the opportunity (i.e., no competent authority is available to disapprove her decision to misclassify the start-up costs).

ATC 1-5 (continued)

- e. Ms. Emerson violated many of the ethical principles some of which included the failure to (1) perform professional duties in accordance with relevant laws, regulations, and technical standards, (2) prepare complete and clear reports and recommendations after appropriate analysis of relevant and reliable information, (3) avoid actual or apparent conflicts of interest and advise all appropriate parties of any potential conflict, (4) refrain from engaging in any activity that would prejudice their ability to carry out their duties ethically, (5) communicate information fairly and objectively, (6) disclose fully all relevant information that could reasonably be expected to influence an intended user's understanding of the reports, comments, and recommendations presented. It is important to note that Ms. Emerson's conduct is beyond the boundaries of mere ethics. Her actions constitute deliberate fraud that could lead to incarceration.
- f. According to the Sarbanes-Oxley Act, the maximum penalty for an intentional misrepresentation of financial statements includes a fine of up to \$5 million and imprisonment of up to 20 years.
- g. This fraud could have been prevented by separating the duties associated with cost classification. Specifically, Ms. Emerson decision regarding the classification of the start-up cost should have required the approval of her boss. Had her boss been knowledgeable, the fraud would have required collusion between Ms. Emerson and her boss. Since collusion between these two parties would have been highly unlikely, the fraud would probably have been prevented. Unfortunately, Ms. Emerson's boss was not properly trained rendering thereby negating a proper separation of duties. Such lapses of proper internal control create an atmosphere that encourages fraud.
