Chapter 2 Job Order Costing

ANSWERS TO QUESTIONS

- The difference between job order costing and process costing relates to the type of
 product or service the company provides, and whether that product or service is
 homogeneous or unique. Job order costing is used by companies that offer
 customized or unique products or services, where each unit or service tends to be
 very different than the next. Process costing is used in companies that offer
 standardized or homogeneous products or services, where each unit or service is very
 similar to the next.
- 2. Job order costing is used in companies that offer customized products or services. Examples include any product that is specially built for a specific customer (e.g. custom home, custom built boat, custom made furniture), unique services provided to customers (e.g. an auto repair shop, a catering business), or industries that serve clients with unique needs (e.g. accounting firm, law firm, architecture firm).
- Process costing is used in companies that offer standardized or homogeneous products or services. Examples include canned and bottled goods, petroleum products, perfume, toilet paper, dishwashing detergent, and many other common household products.
- 4. Examples of service companies that offer homogenized services include Jiffy Lube oil and filter change, a children's haircut salon, a nail salon, a tax return service (e.g. H&R Block), an attorney who provides standardized legal services (such as will

Chapter 02 - Job Order Costing

preparation or traffic cases). In these examples, the basic service the company is performing tends to be fairly similar from one customer to the next. As a result, the company could use process costing to account for the cost of providing the standardized service. As described in the next question, they could then use elements of job order costing to keep track of any "additional" services that are added to the basic service.

5. Examples of itemized bills could include any bill or receipt received from a merchant, restaurant, etc.

- 6. Many companies use a modified (or hybrid) costing system that has elements of both job order and process costing. An example is a computer company that uses process costing to determine the "base cost" of building a computer, plus job order costing to keep track of all of the upgrades that are used to customize it for a particular customer. Auto manufacturers use process costing to account for standardized manufacturing processes (e.g. installing the engine, painting the car, installing tires), then use job order costing to account for the unique components and features that are added to a particular model.
- 7. The three categories of manufacturing costs are direct material, direct labor, and manufacturing overhead. Direct materials are the major material inputs that can be directly and conveniently traced to specific jobs. For an auto repair shop, this would include the major parts that are needed for the repair. Direct labor is the "hands-on" labor, such as the mechanic who does the actual work in an auto repair shop. Manufacturing overhead would include all of the other costs of making a product (or providing a service such as an auto repair) other than direct material and direct labor. For an auto repair shop, this would include the cost of rent and utilities for the repair shop, supervision, depreciation on machines and tools, and incidental supplies such as lubricants, grease, rags, etc.
- 8. The job order cost sheet is used to keep track of all of the costs incurred on a specific job. It should list all of the direct material, direct labor, and manufacturing overhead costs that have been incurred on the job, along with cross-references to the materials requisition form and direct labor time tickets that relate to the specific job.
- 9. In job order costing, any entry to the Work in Process Inventory account should have a corresponding entry to update the individual job cost record, called the job cost sheet. The job cost sheet serves as a subsidiary ledger to the Work in Process Inventory account. If you add up the job cost sheets for all jobs that are currently in process, the total should equal the overall balance in the Work in Process Inventory account.
- 10. A materials requisition form is the source document that must be completed when materials are withdrawn from the warehouse (inventory) to be used in production. The materials requisition form should show the quantity and cost of materials that are withdrawn from inventory, along with an indication of which job(s) the materials will be used for. This allows the accountant to assign the direct materials cost to the appropriate job cost sheet.

- 11. Direct materials are those that can be traced to specific jobs. These costs are added to Work in Process Inventory, with a corresponding entry on the individual job cost sheet. Indirect materials, by definition, are those that cannot be traced to a specific job, or it is simply not worth the effort to do so. Indirect costs are recorded in the Manufacturing Overhead account. These costs get "applied" to Work in Process using a predetermined overhead rate and some secondary allocation measure such as direct labor hours.
- 12. Direct labor time tickets are used to trace the cost of direct labor to specific jobs. The direct labor time ticket should include the number of hours that the employee worked on specific jobs during the week, along with the hourly wage rate paid to that employee. This information is used to assign the direct labor cost to specific jobs by updating the job cost sheets.
- 13. Although the overhead rate might be more accurate if it were based on actual rather than estimated values, companies usually won't know the actual values until it is too late to be used for managerial decision making. Using a predetermined overhead rate based on estimated values allows us to set the overhead rate in advance, so that we can use it to apply the indirect cost to jobs throughout the accounting period. We then "settle up" at the end of the accounting period by adjusting for any difference between actual and applied manufacturing overhead.
- 14. Direct material and direct labor costs can be traced directly to jobs and therefore are assigned directly to the Work in Process Inventory account and the individual job cost sheet. Manufacturing overhead costs cannot be directly traced to jobs. These indirect costs are accumulated in a temporary holding account and applied to Work in Process using a predetermined overhead rate based on some observable allocation base such as direct labor hours.
- 15. Depreciation on office equipment is a nonmanufacturing cost, which must be expensed during the period incurred (period expense). Depreciation on manufacturing equipment is a manufacturing related cost, which according to GAAP must be treated as a cost of the product being made (product cost). Manufacturing costs are counted as inventory (raw materials, work in process, or finished goods) until the product is sold. Because depreciation on manufacturing equipment is an indirect cost (not directly traceable to a specific job), it is counted as part of manufacturing overhead and included as part of the cost of the product.
- 16. A predetermined overhead rate is calculated by estimating the year's total manufacturing overhead cost and dividing it by the estimated value of the allocation base (cost driver). Ideally, the company should select an allocation base that has a cause and effect relationship with the incurrence of cost. Common allocation bases are direct labor hours, direct labor dollars, and machine hours.

- 17. To determine the amount of overhead to apply to Work in Process, you multiply the predetermined overhead rate by the actual value of the allocation base. Applied manufacturing overhead is a function of both actual and estimated data. The predetermined overhead rate is based on estimated values, but this rate is multiplied by the actual value of the allocation base.
- 18. The manufacturing overhead cost that is applied to Work in Process will not necessarily be equal to the actual manufacturing overhead cost incurred. The applied amount is based on a predetermined overhead rate that must be estimated in advance. This rate is then multiplied by the actual value of a secondary allocation base, which may not perfectly capture the actual incurrence of cost.
- 19. Manufacturing overhead is overapplied when the actual manufacturing overhead cost is LESS than the amount that was applied to Work in Process using the predetermined overhead rate. If manufacturing overhead is overapplied, the Manufacturing Overhead account will show a credit balance because the amount applied (credit) is more than the actual overhead costs incurred (debit).
- 20. Manufacturing overhead is underapplied when the actual manufacturing overhead cost is GREATER than the amount that was applied to Work in Process using the predetermined overhead rate. If manufacturing overhead is underapplied, the Manufacturing Overhead account will show a debit balance, because actual overhead costs (debit) were more than the amount applied (credit).
- 21. The most common method for eliminating the balance in the manufacturing overhead account at year end is to transfer the account balance directly to Cost of Goods Sold. If manufacturing overhead is underapplied (debit balance), we will need to increase Cost of Goods Sold (with a debit) and credit Manufacturing Overhead. If manufacturing overhead is overapplied (credit balance), we will need to decrease (credit) Cost of Goods Sold and debit Manufacturing Overhead.

^{*} Due to the nature of cases, it is very difficult to estimate the amount of time students will need to complete them. As with any open-ended project, it is possible for students to devote a large amount of time to these assignments. While students often benefit from the extra effort, we find that some become frustrated by the perceived difficulty of the task. You can reduce student frustration and anxiety by making your expectations clear, and by offering suggestions (about how to research topics or what companies to select).

ANSWERS TO MINI-EXERCISES

M2-1

<u> </u>	1. Golf ball manufacturer.
J	2. Landscaping business.
P	3. Tile manufacturer.
J	4. Auto repair shop.
Р	5. Pet food manufacturer.
Р	6. Light bulb manufacturer.
Р	7. Water bottling company.
J	8. Appliance repair business.
Р	9. DVD manufacturer.
J	10. Music video production company.

M2-2

_DLTT	_1. Employee name.
_MRF	_2. Quantity of direct material used.
_MRF,JCS	_3. Total dollar value of direct materials.
_JCS	_4. Applied manufacturing overhead.
_DLTT	_5. Hours worked by an employee.
_DLTT	_6. Hours a specific employee worked on a particular job.
_JCS	_7. Job start date.
_DLTT	_8. Time an employee clocked in or out.
_DLTT	_9. Different jobs that a specific employee worked on.

M2 - 3

- a. Conversion cost = Total manufacturing cost Direct materials Conversion cost = \$900 – \$300 = \$600
- b. Direct labor = Conversion cost Manufacturing overhead
 Direct labor = \$600 200% Direct labor
 300% Direct labor = \$600
 Direct labor = \$600 / 3 = \$200
- Manufacturing overhead = 200% of Direct labor
 Manufacturing overhead = 200% of \$200
 Manufacturing overhead = \$400
- d. Prime cost = Direct Material + Direct Labor Prime cost = \$300 + \$200 = \$500

M2-4

Reg. 1

Predetermined overhead rate = \$900,000 / \$600,000 = 150% of Direct labor cost

Req. 2

This rate means that manufacturing overhead will be applied at a rate equal to 150% of direct labor cost. For every \$1.00 of direct labor cost, we will apply \$1.50 in manufacturing overhead.

Req. 3

The predetermined overhead rate is based on estimated values because it is set in advance of the accounting period. Often managers won't know the actual manufacturing overhead cost until after the month, quarter, or year has ended. They cannot wait that long to be able to estimate their total manufacturing costs, so they use a predetermined overhead rate that is based on estimates made in advance of the accounting period.

M2-5

Req. 1

Predetermined Overhead Rate = \$900,000 / \$600,000 = 150% of Direct Labor Cost Applied Manufacturing Overhead = Actual Direct Labor Cost X 150% Applied Manufacturing Overhead = \$550,000 X 150% = \$825,000

Rea. 2

Applied manufacturing overhead is based on **both** estimated and actual data. The predetermined overhead rate is based strictly on estimated values. However, to apply manufacturing overhead to specific jobs, we multiply the predetermined (estimated) overhead rate by actual direct labor cost.

M2-6

Req. 1

Predetermined Overhead Rate = \$900,000 / \$600,000 = 150% of Direct Labor Cost Applied Manufacturing Overhead = Actual Direct Labor Cost X 150% Applied Manufacturing Overhead = \$550,000 X 150% = \$825,000

Manufacturing Overhead			
Actual 850,000 825,000 Applied			
Balance 25,000			
Underapplied			

Req. 2

At the end of the accounting period, an adjusting entry is made to transfer the balance in the Manufacturing Overhead account to the Cost of Goods Sold account. In this case, since manufacturing overhead is underapplied, we would need to increase (debit) Cost of Goods Sold by \$25,000, while eliminating the \$25,000 balance in the manufacturing overhead account with a credit, as shown in the following T-accounts:

<u>Manufacturin</u>	g Overhead	Cost of Go	Cost of Goods Sold		
Actual 850,000	825,000 Applied				
Balance 25,000	25,000 Adjust	— → Adjust 25,000			
Underapplied	-	-			

M2-7

Case	Actual Mfg Overhead	Applied Mfg Overhead	Over/Under- applied	Amount
Α	\$100,000	\$105,000	Overapplied	\$5,000
В	79,000	78,000	Underapplied	1,000
С	275,300	261,300	Underapplied	14,000
D	141,000	135,000	Underapplied	6,000

M2-8

Reg. 1

Direct materials added to Work in Process = \$25,000 + \$35,000 = \$60,000

Req. 2

Indirect materials added to Manufacturing Overhead = \$30,000

Req. 3

Raw Materials Inventory			
Beg. Balance 20,000 90,000 Issued to Production			
Purchases	90,000		
End. Balance	20,000		

M2 - 9

_			
\mathbf{r}	_	_	•
ĸ	_	11	
	_	u	

Raw Materials Inventory		90,000
Req. 2		
Work in Process Inventory (\$25,000 + \$35,000)	60,000	
Manufacturing Overhead	30,000	

Raw Materials Inventory.....

90.000

M2 - 10

Reg. 1

Direct Labor Added to Work in Process Inventory = \$22,500

Indirect Labor Added to Manufacturing Overhead = \$4,000 + \$8,000 + \$2,500 = \$14,500

Selling and Administrative Expenses = \$9,000

Req. 2

Only **direct** labor costs are recorded directly in the Work in Process Inventory account, because these costs can be traced to specific jobs in process. Any entry to Work in Process Inventory must have a corresponding update to the specific job cost sheet. Other **indirect** manufacturing related labor costs must be treated as manufacturing overhead. Although these costs are not directly traceable to a specific job, they must be counted as part of the cost of the product, which occurs when manufacturing overhead costs are applied to work in process. Selling and administrative expenses are never counted as part of the cost of the product, but rather are expensed immediately as period costs.

M2-11

$D \wedge a$	- 1	
NEU	. I	

1.04. 1		
Work in Process Inventory	22,500	
Manufacturing Overhead (\$4,000 + \$8,000 + \$2,500)	14,500	
General and Administrative Salary Expense	9,000	
Salary and Wages Payable		46,000

Req. 2

Applied manufacturing overhead = Predetermined overhead rate x Actual value of allocation base

Applied manufacturing overhead = $$50 \times 750$ Direct labor hours = \$37,500

M2 - 12

Req. 1

Manufacturing Overhead

<u>Actual</u>	<u>Applied</u>
Indirect materials 15,000	750 DL hours
Factory supervision 4,000	x \$50 Predetermined OH rate
Production engineer 6,000	37,500
Factory janitorial work 2,500	·
Other factory overhead 7,500	
35,000	
	2,500 Balance
	(Overapplied)

Req. 2

37,500 - 35,000 = 2,500 overapplied

M2-13

Req. 1

Req. 2

This entry will decrease Cost of Goods Sold, which makes sense since manufacturing overhead was OVERAPPLIED. In other words, we applied too much cost to Work in Process Inventory, Finished Goods Inventory, and eventually to Cost of Goods Sold.

M2 - 14

Total current manufacturing costs + Beginning work in process inventory – Ending work in process inventory = Cost of goods manufactured

Total current manufacturing costs + \$30,000 - \$25,000 = \$180,000

Total current manufacturing costs = \$180,000 - \$30,000 + \$25,000

Total current manufacturing costs = \$175,000

M2 - 15

Cost of goods manufactured	\$320,000
+ Beginning finished goods inventory	45,000
 Ending finished goods inventory 	<u>- 35,000</u>
Cost of goods sold	<u>\$330,000</u>

M2 - 16

Direct material used + Direct labor + Applied manufacturing overhead = Total current manufacturing costs

Direct material used + \$60,000 + (\$60,000 x 200%) = \$300,000

Direct material used = \$300,000 - \$60,000 - \$120,000

Direct material used = \$120,000

M2 - 17

Miscellaneous (overhead) costs for an auto-repair shop would include rent on the garage, supervision, miscellaneous parts and supplies, depreciation on tools and machinery, utilities, etc.

M2-18

	Total Current Manufacturing Costs	Beginning Work in Process Inv	Ending Work in Process Inv	Cost of Goods Manufactured
Α	\$7,200	\$2,100	\$1,650	\$7,650

Work in Process Inventory	17,550	
Manufacturing Overhead	2,140	
Wages Payable		19,690

Work in Process Inventory (\$17,550 X 150%)	26,325	
Manufacturing Overhead		26,325

Req. 1

Job 271 = (8 hrs + 8 hrs) X \$30 per hour =	\$	480
Job 272 = (8 hrs + 4 hrs) X \$30 per hour =		360
Job 273 = 8 hrs X \$30 per hour =	_	240
Total Direct Labor Assigned to Jobs	<u>\$1</u>	.080

Req. 2

The time that Joyce spends doing maintenance (4 hours X \$30 = \$120) cannot be traced to specific jobs and will be treated as indirect labor, which is recorded in the Manufacturing Overhead account rather than Work in Process Inventory.

E2-4

Work in Process Inventory	1,080	
Manufacturing Overhead	120	
Wages Payable		1,200

E2-5

Req. 1

Must first determine expected number of DL hours. Estimated DL Cost / DL rate = Estimate DL hours \$300,000 / \$15.00 = 20,000 DL hours expected

Predetermined Overhead Rate = Estimated Mfg. Overhead / Estimated DL hours

Estimated Total Manufacturing Overhead:

Factory machinery depreciation	\$55,000
Factory supervisor salaries	140,000
Factory supplies	7,500
Factory property tax	37,500
Total Estimated MOH	\$240,000

Predetermined Overhead Rate = \$240,000 / 20,000 DL Hours = \$12.00 per DL Hour

Note that \$15 is the direct labor rate, while \$12 is the predetermined overhead rate.

Req. 2 Applied Overhead = Overhead Rate x Actual DL Hours = \$12.00 x 18,500 DL Hours = \$222,000

E2-6

	Case 1	Case 2	Case 3
Direct material used	\$12,000	\$15,000	\$15,000
Direct labor	25,000	12,000	8,000
Manufacturing overhead applied	37,500	18,000	12,000
Total current manufacturing costs	74,500	45,000	35,000
Beginning work in process inventory	10,000	8,000	9,000
Ending work in process inventory	12,000	7,000	12,000
Cost of goods manufactured	72,500	46,000	32,000
Beginning finished goods inventory	15,000	10,000	8,000
Ending finished goods inventory	12,000	8,000	6,000
Cost of goods sold	75,500	48,000	34,000

Detailed calculations provided below:

- a. Manufacturing overhead applied = 150% of Direct labor
 Manufacturing overhead applied = 150% X \$25,000
 Manufacturing overhead applied = \$37,500
- b. Direct materials + Direct labor + Manufacturing overhead applied = Total current manufacturing costs \$12,000 + \$25,000 + \$37,500 = \$74,500
- Total current manufacturing costs + Beginning work in process inventory Ending work in process inventory = Cost of goods manufactured \$74,500 + \$10,000 - \$12,000 = \$72,500
- d. Cost of goods manufactured + Beginning finished goods inventory Ending finished goods inventory = Cost of goods sold
 \$72,500 + \$15,000 \$12,000 = \$75,500
- e. Manufacturing overhead applied = 150% x Direct labor \$18,000 = 150% x Direct labor Direct labor = \$12,000

f. Direct materials + Direct labor + Manufacturing overhead applied = Total current manufacturing costs

Direct materials + \$12,000 + \$18,000 = \$45,000

Direct materials = \$15,000

- g. Total current manufacturing costs + Beginning work in process inventory Ending work in process inventory = Cost of goods manufactured
 \$45,000 + Beginning work in process inventory \$7,000 = \$46,000
 Beginning work in process inventory = \$8,000
- h. Cost of goods manufactured + Beginning finished goods inventory Ending finished goods inventory = Cost of goods sold
 \$46,000 + \$10,000 Ending finished goods inventory = \$48,000
 Ending finished goods inventory = \$8,000
- i. Conversion cost = Total current manufacturing costs Direct materials Conversion cost = \$35,000 – \$15,000 Conversion cost = \$20,000

Conversion cost = Direct labor + Manufacturing overhead applied Conversion cost = Direct labor + (1.5 x Direct labor)

 $$20,000 = (1 \times Direct labor) + (1.5 \times Direct labor)$

 $$20,000 = (2.5 \times Direct labor)$

Direct labor = \$8,000

- Manufacturing overhead applied = 1.5 x Direct labor
 Manufacturing overhead applied = 1.5 x \$8,000
 Manufacturing overhead applied = \$12,000
- k. Total current manufacturing costs + Beginning work in process inventory Ending work in process inventory = Cost of goods manufactured \$35,000 + \$9,000 Ending work in process inventory = \$32,000 Ending work in process inventory = \$12,000
- I. Cost of goods manufactured + Beginning finished goods inventory Ending finished goods inventory = Cost of goods sold
 \$32,000 + Beginning finished goods inventory \$6,000 = \$34,000
 Beginning finished goods inventory = \$8,000

Req. 1

Predetermined overhead rate = \$325,000 / 25,000 = \$13 per machine hour

Req. 2

Applied manufacturing overhead = Predetermined overhead rate X Actual value of allocation base

Applied manufacturing overhead = \$13 x 26,000 actual machine hours = \$338,000

Req.3

450

Req. 1

Predetermined Overhead Rate = Estimated Overhead / Estimated Direct Labor

- = \$90,000 / \$120,000
- = \$0.75 per DL Dollar

Req. 2

Work in Process			
Beginning Balance 41,000			
Direct Materials 75,000	65,000		
Direct Labor 120,000	74,500		
Overhead 90,000	67,500		
Ending Balance 61,000			

Req. 3

Job 248 (As of August 31):

Direct Material	?
Direct Labor	24,000
Applied Manufacturing Overhead (75% x 24,000)	?
Total Manufacturing Cost	61,000

Applied Manufacturing Overhead = $$24,000 \times 75\% = $18,000$ Direct Materials = \$61,000 - \$24,000 - \$18,000 = \$19,000

Req. 1

Predetermined Overhead Rate: \$346,500 / (\$150,000 + 81,000) = 150% of Salary Cost

Req. 2

	<u>Debbie</u>	<u>Tara</u>
Annual Salary Overhead (150% of Salary) Total Cost	\$150,000 <u>225,000</u> \$375,000	\$81,000 <u>121,500</u> 202,500
Billable Hours Hourly Cost	2,000 \$187.50	1,800 \$112.50
Mark-up (20%)	<u>37.50</u>	22.50
Billing Rate	\$225.00	\$135.00

Req. 1

Applied manufacturing overhead = Predetermined overhead rate X Actual value of allocation base

Applied manufacturing overhead = \$15 X 158 Direct labor hours = \$2,370

Req. 2

Direct materials	\$ 7,500
Direct labor	3,200
Applied manufacturing overhead	2,370
Total manufacturing cost	\$13,070

Req. 3

Revenue = 130% of total manufacturing cost

Revenue = $1.30 \times $13,070 = $16,991$

Req. 4

Gross profit = Sales revenue - Cost of goods sold

Gross profit = \$16,991 - \$13,070 = \$3,921

E2-14

Cost of Goods Sold	13,070
Cash	16,991

E2-15

<u>Description</u>	<u>Transaction</u>
Applied Manufacturing Overhead	(e)
Recorded Direct Labor	(d)
Recorded the Cost of Jobs Completed	(f)
Purchased Raw Materials	(a)
Recorded Actual Manufacturing Overhead	(c)
Recorded the Cost of a Jobs Sold	(g)
Issued Raw Materials to Production	(b)

Req. 1

Predetermined overhead rate = \$300,000 / 20,000 = \$15 per DL hour

Req. 2

Applied manufacturing overhead = Predetermined overhead rate x Actual value of allocation base

Applied manufacturing overhead = $$15 \times 1,500$ actual direct labor hours = \$22,500

$D \wedge a$	2
1754	J

Indirect Labor	\$ 4,500
Indirect Material	2,500
Factory Rent	4,200
Factory Supervision	4,700
Factory Depreciation	5,600
Factory Janitorial Work	1,200
Factory Insurance	2,600
Actual Manufacturing Overhead Costs	<u>\$25,300</u>

Req. 4

Manufacturing Overhead			
Actual 25,300	22,500 Applied		
Balance 2,800 (Underapplied)			

Req. 1

Applied manufacturing overhead = Predetermined overhead rate x Actual value of allocation base

Applied manufacturing overhead = \$15 x 1,500 actual direct labor hours = \$22,500

Work in Process Inventory Manufacturing Overhead		22,500
Req. 2 Manufacturing Overhead Cash, Payables, etc		25,300
Req. 3 Cost of Goods Sold	•	2,800

This entry will increase Cost of Goods Sold. This is appropriate since manufacturing overhead costs were underapplied (i.e., we did not apply enough cost to Work in Process, Finished Goods, and ultimately Cost of Goods Sold).

Req. 1

Raw Materia 1/1 32,000 a. 20,000 Bal. 15,800	b. 36,200	1/1 15,500 b. 33,000 c. 12,900 d. 15,000	ess Inventory f. 32,150	Finishe 1/1 20,000 f. 32,150 Bal. 32,150	d Goods g. 20,000

h. Accounts Receivable	500,000

PA2-3

Req. 1

Predetermined overhead rate = \$420,000 / 60,000 = \$7.00 per machine hour

Req. 2

Total Applied Manufacturing Overhead = 7,000 hours X \$7.00 = \$49,000

Req. 3

Ending Work in Process Inventory (Job 103) = $$9,600 + $9,600 + (2,000 \text{ machine hours} \times $7.00) = $33,200$

Reg. 4

Cost of Job 101 = \$19,200 + \$28,800 + (1,000 machine hours X \$7.00) = \$55,000

Since this was the only job sold, the gross profit before the adjustment for over or underapplied manufacturing overhead is \$60,000 - \$55,000 = \$5,000.

Req. 5

Req. 1

- a. Predetermined overhead rate = \$594,000 / 16,500 = \$36.00 per direct labor hour
- b. Applied manufacturing overhead = 18,000 actual direct labor hours x \$36 = \$648,000
- c. \$655,000 Actual \$648,000 Applied = \$7,000 Underapplied

Req. 2

- a. Predetermined overhead rate = \$594,000 / \$396,000 = 150% of direct labor cost
- b. Applied manufacturing overhead = $$450,000 \times 150\% = $675,000$
- c. \$655,000 Actual \$675,000 Applied = \$20,000 Overapplied

Req. 3

- a. Predetermined overhead rate = \$594,000 / 7,500 = \$79.20 per machine hour
- b. Applied manufacturing overhead = 8,500 actual machine hours x \$79.20 = \$673,200
- c. \$655,000 Actual \$673,200 Applied = \$18,200 Overapplied

Req. 4

Based on last year's data, direct labor hours was the most accurate allocation base for applying manufacturing overhead, because it results in the lowest amount of over- or underapplied manufacturing overhead, or the smallest difference between actual and applied manufacturing overhead cost.

Req. 5

Ideally, companies should choose an allocation base that has a cause and effect relationship with the incurrence of manufacturing overhead cost. In addition, the allocation measure must be something that can be reasonably measured for each individual unit or job, and the benefits must outweigh cost of measurement. This is one reason that many companies choose to use direct labor hours to apply manufacturing overhead to production. This measure is already captured in the accounting system and often has a direct relationship with the incurrence of manufacturing overhead cost. However, with advances in automation and the changing nature of the labor force, direct labor hours is not necessarily the best measure for applying manufacturing overhead to production.

PA2-8
Req. 1
Predetermined overhead rate = \$91,000 / 65,000 = 140% of Direct labor cost Req. 2

Plus: Beginning Work in Process Inventory	22,900		
Total Work in Process	\$706,500		
Less: Ending Work in Process Inventory	99,250		
Cost of Goods Manufactured	\$607,250		

Req. 5

Coda Industries Income Statement For the Month of November				
Sales Revenue		\$850,000		
Less: Cost of Goods Sold				
Beginning Finished Goods Inventory	130,000			
Plus: Cost of Goods Manufactured (see schedule				
above)	607,250			
Less: Ending Finished Goods Inventory	179,550			
Unadjusted Cost of Goods Sold	557,700			
Plus: Underapplied Manufacturing Overhead	37,000			
Adjusted Cost of Goods Sold		\$594,700		
Gross Profit		255,300		
Less: Operating (Period) Expenses		157,800		
Net Income from Operations		\$97,500		

a. Raw Materials Inventory	270,500
b. Manufacturing Overhead	195,500
c. Work In Process Inventory	267,000
d. Selling and Administrative Expenses (65,300 + 92,500) 157,800 Manufacturing Overhead (68,300 + 125,000 + 64,800) 258,100 Miscellaneous Accounts	415,900
e. Work in Process Inventory	290,000
f. Finished Goods Inventory	607,250
g Cost of Goods Sold	557,700
h. Accounts Receivable	850,000

Req. 1

Predetermined overhead rate = \$450,000 / 150,000 = \$3.00 per machine hour

Req. 2

Applied manufacturing overhead = 17,000 machine hours X \$3.00 = \$51,000

Req. 3

Ending Work in Process Inventory (Job 103) = \$8,500 + \$13,600 + (5,000 machine hours X \$3.00) = \$37,100

Req. 4

Cost of Job $101 = \$25,500 + \$11,900 + (8,000 \times \$3.00) = \$61,400$

Since this was the only job sold, the gross profit before the adjustment for over or underapplied manufacturing overhead is \$75,000 - \$61,400 = \$13,600.

Req. 5

Manufacturing Overhead

Chapter 02 - Job Order Costing

	i. 50,000	i.	a. 42,000
•	Bal. 50,000		c. 30,000
			d. 34,000e. 9,000f. 7,900
			Bal. 72,900

Req. 2 Unadjusted gross profit = \$50,000 - \$40,000 = \$10,000

Req. 3 Manufacturing overhead is \$2,850 underapplied

Req. 4 Adjusted Gross Profit = \$50,000 - (\$40,000 + \$2,850) = \$7,150

<u>ltem</u>	<u>Amount</u>
Direct Materials Used In Production	\$87,643
Direct Labor	128,857
Manufacturing Overhead Applied	225,500
Total Current Manufacturing Costs	\$442,000
Plus: Beginning Work in Process Inventory	32,000
Less: Ending Work in Process Inventory	24,000
Cost of Goods Manufactured	\$450,000
Plus: Beginning Finished Goods Inventory	15,000
Less: Ending Finished Goods Inventory	19,500
Unadjusted Cost of Goods Sold	\$445,500
Overhead Adjustment	-120,500
Adjusted Cost of Goods Sold	\$325,000

Req. 1

- a. Predetermined overhead rate = \$700,000 / 25,000 = \$28.00 per direct labor hour
- b. Applied manufacturing overhead = 27,000 actual hours x \$28 = \$756,000
- c. \$750,000 Actual \$756,000 Applied = \$6,000 Overapplied

Req. 2

- a. Predetermined overhead rate = \$700,000 / \$437,500 = 160% of direct labor cost
- b. Applied manufacturing overhead = \$464,000 x 160% = \$742,400
- c. \$750,000 Actual \$742,400 Applied = \$7,600 Underapplied

Req. 3

- a. Predetermined overhead rate = \$700,000 / 12,500 = \$56 per machine hour
- b. Applied manufacturing overhead = 13.000 actual machine hours x \$56 = \$728.000
- c. \$750,000 Actual \$728,000 Applied = \$22,000 Underapplied

Req. 4

Based on last year's data, direct labor hours was the most accurate allocation base for applying manufacturing overhead, because it results in the lowest amount of over- or underapplied manufacturing overhead, or the smallest difference between actual and applied manufacturing overhead cost.

Req. 5

Ideally, companies should choose an allocation base that has a cause and effect relationship with the incurrence of manufacturing overhead cost. In addition, the allocation measure must be something that can be reasonably measured for each individual unit or job, and the benefits must outweigh cost of measurement. This is one reason that many companies choose to use direct labor hours to apply manufacturing overhead to production. This measure is already captured in the accounting system and often has a direct relationship with the incurrence of manufacturing overhead cost. However, with advances in automation and the changing nature of the labor force, direct labor hours is not necessarily the best measure for applying manufacturing overhead to production.

Req. 1 Predetermined overhead rate = \$75,600 / \$42,000 = 180% of Direct labor cost Req. 2

Raw Materials Inv	rentory	Work in Process Inventory		
Beginning Balance 10,000 Purchases 85,000 Ending Balance 18,500	76,500 (10,000 + 85,000 – 18,500)	Beginning Balance Direct Materials Direct Labor Applied Overhead (\$35,000	30,000 66,500 35,000 63,000 X 180%)	174,500 (30,000 + 66,500 + 35,000 + 63,000 - 20,000)

ANSWERS TO SKILLS DEVELOPMENT CASES

S1-1

The solution to this case will depend on the particular item that the student chooses to investigate. The primary purpose of this case is to get students to think more concretely about what is involved in manufacturing a product. Since most students at this level will have very limited work experience, and may never have been inside a manufacturing facility, this exercise will help make the definitions in the chapter more concrete. Tying it to an everyday item that they use will also allow them to visualize the end product and the different types of costs that go into making that product.

S2-2

Solutions to this case will vary depending on the business venture that students select.

S2-3

Req. 1

Predetermined Overhead Rate = **Estimated Total Overhead Estimated Allocation Base**

Predetermined Overhead Rate = \$720,000 24,000 DL Hours

Predetermined Overhead Rate = \$30 per DL Hour

This rate means the company needs to apply \$30 in overhead for each direct labor hour worked in order to cover all of the indirect costs of production, such as factory rent, utilities, supervision, depreciation, etc.

Req. 2

Applied Overhead = Predetermined Overhead Rate X Actual DL Hours

Applied to Job 102 = \$30 X 300 hours = \$ 9,000 Applied to Job 103 = \$30 X 200 hours = 6,000 Total Overhead Applied = \$30 X 500 hours = \$15.000

Req. 3

	Job 102	Job 103
Beginning balance of jobs in process	\$ 15,000	\$ -
Direct materials	2,000	5,000
Direct labor	6,000	4,000
Manufacturing overhead applied	9,000	6,000
Total manufacturing cost	<u>\$32,000</u>	<u>\$15,000</u>

Since Job 102 was completed, but not sold, its cost of \$32,000 would appear in Finished Goods Inventory. The \$15,000 balance of Job 103 would appear in Work in Process inventory since it is not yet completed.
