C HAPTER2 Functions and Their Graphs

Section 2.1 Linear Equations in Two Variables

- 1. linear **14.** The line appears to go through (0, 7) and (7, 0.)
- 2. slope $y_2 y_1 = 0 7 = -1$

3. point-slope

 $x_2 - x_1$ 7 - 0

15. y = 5x + 3

- 4. parallel
- 5. perpendicular
- 6. rate or rate of change
- 7. linear extrapolation
- 8. general
- 9. (a) $m = \frac{2}{3}$. Because the slope is positive, the line rises. Matches L_2 .
 - (b) m is undefined. The line is vertical. Matches L_3 .
 - (c) m = -2. The line falls. Matches L_1 .

16. Slope: m = -1

Slope: m = 5

y-intercept: (0, 3)

у

(b) *m*

e

is negative, the line y falls. Matches L_1 .

(c) m = 1. Because the slope is positive, the line rises. Matches L₃.

m = 0

17.
$$y = -\frac{3}{4}x - 1$$

Slope: $m = -\frac{3}{4}$
y-intercept: 0, (-1)

х

13. Two points on the line: (0, 0) and (4, 6)

Slope =
$$\frac{y_2 - y_1}{x_2 - x_1} = 6 = 3 - x_2 - x_1 = 4 = 2$$

35. Point: (5, 7, Slope:) m = 0

Because m = 0, y does not change. Three other points are (-1, 7, 0, 7, and 4) () (7).

36. Point: (3, -2), Slope: m = 0

Because m = 0, y does not change. Three other points are (1, -2) (, 10, -2), and (-6, -2). **37.** Point: (-5, 4) Slope: m = 2

Because m = = 2 $\frac{2}{1}$, y increases by 2 for every one unit increase in x. Three additional points are (-4, 6,) (-3, 8) and (-2, 10)

38. Point: (0, -9), Slope: m =-2 Because m = -2, y decreases by 2 for every one unit increase in x. Three other points are (-2,5), (1, -11), and 3, (-15). **39.** Point: (4, 5,) Slope: m = $-\frac{1}{3}$ Because $m = -\frac{1}{3}$, y decreases by 1 unit for e unit increase in x. Three additional points are (-2, 7,(0, 0, 1) $(-\frac{19}{4})$, and 1, 6.()

40. Point: (3, -4), Slope: m =

Because $m = \frac{1}{4}$, y increases by 1 unit for e increase in x. Three additional points are

(-1,5) (,1,-11), and 3,(-15.)

41. Point: (-4, 3,) Slope is undefined. Because m is undefined, xdoes not change. Three points are (-4, 0,) (-4, -4, 0,)5, and (-4, 2)

42. Point: (2, 14,) Slope is undefined.

Because m is undefined, x does not change. Three other points are (2, -3) (2, 0, and 2,) (4) 45. Point: (-3, 6;) m = -2

43. Point: (0, -2); m = 3

$$y + 2 = 3(x - 0) y = 3x - 2$$

44. Point: (0,10;) m = -1

$$y - 10 = -1(x - 0)y - 10 = -xy = -+x10$$

47. Point: $(4, 0;) m = -\frac{1}{3}$ y - = -0 $\frac{1}{3}(x - - -)$ 4) $y = -\frac{1}{3}(x - -)$

 $y - 0.6 = \binom{x}{4} + \binom{8}{10}$ $\frac{\frac{3}{10}}{y - 0.6} = -(x + 8)x$ $10y - 6 = -3(x + 8)m_1 =$ 10y - 6 = -3x - 24 10y = -3x - 18 $y = -\frac{-3}{5}x - \frac{9}{5} \text{ or } y = -0.3x - 1.8$ 10 - 5

68.
$$L_1: y = -\frac{4}{5}x - 5 m_1 = -\frac{4}{5}$$

 $L_2: y = \frac{5}{4}x + 1 m_2 = \frac{4}{4}$

The slopes are negative reciprocals, so the lines are perpendicular.

69.
$$L_1: 0(, -1) (, 5, 9)$$

 $m_1 = \frac{9+1}{5-0} = 2$
 $L_2: 0(, 3, 4) (1)$
 $m_2 = \frac{1}{3} = -\frac{1}{2}$

The slopes are negative reciprocals, so the lines are perpendicular.

70.
$$L_1:(-2, -1)(, 1, 5)$$

$$m_1 = \frac{5 - (-1)}{1 - (-1)} = \frac{-6}{3} = 2$$

$$L_{2:} 1(, 3, 5,) (-5)$$

$$m_{2} = -5 - 3 = -8 = -2$$

The lines are neither parallel nor perpendicular.

71.
$$L_1: (-6, -3) (, 2, -3)$$

 $m_1 = = = 0$

67.
$$L_1: y = x - 3$$
 $\frac{1}{2}$
 $L_2: y = - +x$ 1
 $m_2 = -$

 $\frac{1}{2}$

 $m^2 = 4$

The lines are neither parallel nor perpendicular.

$$\frac{-3 - (-3)}{2^{-} (-\frac{1}{6})}$$

$$L_2: 3(, -\frac{1}{2}), 6, (-\frac{1}{2})$$

$$m_2 = \frac{-\frac{1}{2} - (-\frac{1}{2})}{-\frac{1}{6}} = -\frac{0}{3} = 0$$

 L_1 and L_2 are both horizontal lines, so they are parallel.

72.
$$L_{1}: 4(, 8,)(-4, 2)$$

 $m^{1} = \frac{2}{2}$
 $-\frac{8}{6}$

 $x - y$
83. $\frac{x}{-y} + \frac{-y}{-2'3} = 1$

177

- + - = 1 $d \quad d$

88. (a) greatest increase = largest slope

$$-3 + 4 = d$$

$$1 = \frac{178}{d}$$
Chapter 2 Functions and Their Graphs
$$x + y = 1 x + y$$

$$y - 1 = 0$$

- **87.** (a) *m* = 135. The sales are increasing 135 units per year.
 - (b) m = 0. There is no change in sales during the year.
 - (c) m = -40. The sales are decreasing 40 units per (b) (9,42.91,)
 - (15,233.72) year.

So, the sales increased the greatest between the years 2014 and 2015.

least increase = smallest slope

$$(13,170.91,)(14,182.20)$$

m $\frac{182.20 - 170.91}{14 - 1.29}$

So, the sales increased the least between the years 2013 and 2014.

$$=\frac{233.72-42.91}{15-9}=\frac{190.81}{6}=31.80$$

т

The slope of the line is about 31.8.

(c) The sales increased an average of about \$31.8 billion each year between the years 2009 and 2015.

89.
$$y = \frac{6}{100}x y = \frac{6}{100}(200) = 12$$
 feet

$$m = \frac{0 - 875}{5 - 0} = -175$$
$$V = -175t + 875, 0 \le t \le 5.$$

96. Using the points (0, 24,000 and 10, 2000 ,) () where the first coordinate represents the year *t* and the second coordinate represents the value *V*, you have

$$m = \frac{2,000 - 24,000}{10 - 0} = \frac{-22,000}{10} = -2200.$$

Since the point (0, 24,000) is the *V*-intercept, b = 24,000, the equation is

 $V = -2200t + 24,000, 0 \le t \le 10.$

97. Using the points (0, 32 and 100, 212,) () where the first coordinate represents a temperature in degrees Celsius and the second coordinate represents a temperature in degrees Fahrenheit, you have

m =
$$212$$
 - $-32 = 180 = 9.100$ 0
100 5

Since the point (0, 32) is the *F*-intercept, b = 32, the

equation is F = 1.8C + 32 or $C = {}^{5}F - {}^{160} - {}^{160} - {}^{9} 9$

98. (a) Using the points (1, 970 and 3,1270,) () you have

$$m = \overline{1270 \ -970} = \underline{300} = 150.$$

Using the point-slope form with m = 150 and the point (1, 970) you have

$$y - y_1 = m t(-t_1) y$$

- 970 = 150(t - 1)
$$y - 970 = 150t - 150$$

$$y = 150t + 820.$$

(b) The slope is m = 150. The slope tells you the amount of increase in the weight of an average male child's brain each year.

(c) Let
$$t = 2$$
: $y = 1502() + 820$

$$y = 300 + 820 y$$

= 1120

(e) Answers will vary. *Sample answer:* No. The brain stops growing after reaching a certain age.

99. (a) Total Cost = cost for cost purchase fuel and +

$$C = 9.5t + 11.5t + 42,000 C$$

= 21t + 42,000

(b) Revenue = Rate per hour \cdot Hours

$$R = 45t$$
 (c)

$$P = R - C$$

$$P = 45t - (21t + 42,000)$$
$$P = 24t - 42,000$$

(d) Let P = 0, and solve for *t*.

$$0 = 24t - 42,000$$

$$42,000 = 24t$$

$$1750 = t$$

The equipment must be used 1750 hours to yield a profit of 0 dollars.

100. (a)

The average brain weight at age 2 is 1120 grams. (d) Answers will vary.

0

(b) $y = 2 \cdot 15(+2x) + 2 \cdot 10(+2x) = 8x + 50$ (c) ¹⁵⁰

- (d) Because m = 8, each 1-meter increase in x will increase y by 8 meters.
- 101. False. The slope with the greatest magnitude corresponds to the steepest line.
- 102. (-8, 2) and (-1, 4:) $m_1 = \frac{4}{2} = \frac{2}{1}$ $1 = \frac{2}{1}$

(0, -4) and (-7, 7:)
$$m_2 = \frac{7}{-}(-4) = \frac{14}{-7}$$

False. The lines are not parallel.

103. Find the slope of the line segments between the points A and B, and B and C.

Since the slopes are negative reciprocals, the line segments are perpendicular and therefore intersect to

form a right angle. So, the triangle is a right triangle. 104. On a vertical line, all the points have the same *x*-value,

so when you evaluate $m = \frac{y_2 - y_1}{have x_2 - x_1}$, you would

a zero in the denominator, and division by zero is undefined.

$$106. \quad d_{1} = \sqrt{\frac{(x-x)^{2} + (y-y)^{2}}{2 - 1 - 2 - 1}} \qquad d_{2} = \sqrt{\frac{(x-x)^{2} + (y-y)^{2}}{2 - 1 - 2 - 1}} = \sqrt{\frac{(1-0)^{2} + (m_{1}-0)^{2}}{2 - 1}} = \sqrt{\frac{(1-0)^{2} + (m_{1}-0)^{2}}{2 - 1}} = \sqrt{\frac{(1-0)^{2} + (m_{1}-0)^{2}}} = \sqrt{\frac{(1-0)^{2} + (m_{1}-0)^{2}}{2 - 1}} = \sqrt{\frac{(1-0)^{2} + (m_{1}-0)^{2}}{2 - 1}} = \sqrt{\frac{(1-0)^{2} + (m_{1}-0)^{2}}{2 - 1}} = \sqrt{\frac{(1-0)^{2} + (m_{1}-0)^{2}}} = \sqrt{\frac{(1-0)^{2} + (m_{1}-0)^{2}}} = \sqrt{\frac{(1-0)^{2} + (m_{1}-0)^{2}}{2 - 1}} = \sqrt{\frac{(1-0)^{2} + (m_{1}-0)^{2}}{2 - 1}} = \sqrt{\frac{(1-0)^{2} + (m_{1}-0)^{2}}{2 - 1}} = \sqrt{\frac{(1-0)^{2} + (m_{1}-0)^{2}}}$$

Using the Pythagorean Theorem:

()
$$d_{12} + (d_2)_{2} =$$
 (distance between 1,(m_1), and 1,(
 m_2))²
 m_2) m_2)²
 m_2) m_2)
 m_2) m_2
 m_1)² + $(m_2)^2 + (m_2 - m_1)^2$
 $(m_1)^2 + (m_2)^2 + 2 = (m_2)^2 - 2m m_{12} + (m_1)^2$
 $2 = -2m m_{12}$
 $m_1 = m_1 m_2$
No, the slopes of two perpendicular lines have opposite signs. (Assume that $m_1 = 108$ Because $\frac{1}{2} ||_{12} \frac{5}{2}$ the

107. No, the slopes of two perpendicular lines have opposite signs. (Assume that neither line is vertical or horizontal.)

>4

> slope of -4. The slope with the greatest magnitude corresponds to the steepest line.

 $\Box \Box 1 + (m_1)_2 \Box \Box^2 + \Box \Box 1 + (m_2)_2 \Box \Box^2 = \Box \Box (1 - 1)_2 + (m_2 - m_1)_2 \Box \Box_2$

109. The line y = 4x rises most quickly.

The line y = -4x falls most quickly.

The greater the magnitude of the slope (the absolute value of the slope), the faster the line rises or falls. 110. (a) Matches graph (ii).

The slope is -20, which represents the decrease in

the amount of the loan each week. The y-intercept is

(0, 200), which represents the original amount of the loan.

(b) Matches graph (iii).

The slope is 2, which represents the increase in the hourly wage for each unit produced. The y-intercept

is (0,12.5,) which represents the hourly rate if the

employee produces no units.

(c) Matches graph (i).

The slope is 0.32, which represents the increase in travel cost for each mile driven. The y-intercept is

(0, 32,) which represents the fixed cost of \$30 per day for meals. This amount does not depend on the number of miles driven.

(d) Matches graph (iv).

The slope is -100, which represents the amount by

which the computer depreciates each year. The

yintercept is (0, 750), which represents the original purchase price.

This line is the perpendicular bisector of the line segment connecting (4' - 1) and (-2, 3)

112. Set the distance between (6, 5) and (x, y) equal to the distance between (1, -8) and (x, y).

$$\sqrt{(x-6)^2 + (y-5)^2} = (\sqrt{-1})^2 + (y--(8))^2$$

$$(x-6)^2 + (y-5)^2 = (x-1)^2 + (y+8)^2 x^2 - 12x + 36 + y^2 - 10y + 25$$

$$= x^2 - 2x + 1y^2 + 16y + 64$$

$$x^{2} + y^{2} - 12x - 10y + 61 = x^{2} + y^{2} - 2x + 16y + 65^{x}$$

$$-\frac{2}{-4} = \frac{7}{4} = \frac{3}{2} = \frac{2}{-6} = \frac{2}{-8} = \frac{7}{(1, -8)}$$

$$-12x - 10y + 61 = - +2x \quad 16y + 65$$

$$-10x - 26y - = 4 \qquad 0 -25(x + 13y + 2) = 0$$

$$5x + 13y + = 2 \quad 0$$

113. Set the distance between
$$(3, \frac{5}{2})$$
 and (x, y) equal to the distance between $(-7, 1)$ and (x, y) .

$$\sqrt{(x-3)^2 + (y-5_2)^2} = 12 (x-7)^2 (y-1)^2$$

$$(x-3)^2 + (y-5_2)^2 = (x+7)^2 + (y-1)^2$$

$$x^2 - 6x + 9 + y^2 - 5y + \frac{2x}{4} = x^2 + 14x + 49 + y^2 - 2y + 1$$

$$-6x - 5y + \frac{64}{4} = 14x - 2y + 50$$

$$-24x - 20y + 61 = 56x - 8y + 200$$

$$80x + 12y + 139 = 0$$

This line is the perpendicular bisector of the line segment connecting $(3, \frac{5}{2})$ and (-7, 1.)

114. Set the distance between $\left(-\frac{1}{2}, 4\right)$ and (x, y) equal to the distance between $\left(\frac{7}{2}, \frac{5}{2}\right)$ and (x, y).

$$\sqrt{\left(x - -\left(\frac{1}{2}\right)\right)^{2} + \left(y - -\left(\frac{4}{2}\right)\right)^{2}} = \sqrt{\left(x - \frac{7}{2}\right)^{2} + \left(y - \frac{5}{4}\right)^{2}}$$

$$\left(x + \frac{1}{2}\right)^{2} + \left(y + 4\right)^{2} = \left(x - \frac{7}{2}\right)^{2} + \left(y - \frac{5}{4}\right)^{2}$$

$$x^{2} + x + \frac{1}{2} + \frac{y^{2}}{2} + \frac{8y}{16} = \frac{x^{2}}{7x} - \frac{52}{52} \frac{y}{22116} + \frac{22116}{x} + \frac{2}{2}$$
independent; dependent

$$8y + \frac{654}{654} = -7x - \frac{52}{52} \frac{y}{22116} + \frac{2}{2}$$
implied domain

$$8x + \frac{212}{y} + \frac{1639}{1639} = 0$$
5. Yea, the relationship is a function. Each domain

128x + 168y + 39 = 0

Section 2.2 Functions

- 5. Yes, the relationship is a function. Each domain value is matched with exactly one range value.
- 6. No, the relationship is not a function. The domain value of -1 is matched with two output values.

1. domain; range; function

© 2018 Cengage Learning. All Rights Reserved. May not be scanned, copied or duplicated, or posted to a publicly accessible website, in whole or in part.

- 7. No, it does not represent a function. The input values of 10 and 7 are each matched with two output values.
- 8. Yes, the table does represent a function. Each input value is matched with exactly one output value.

Input, <i>x</i>	2	42	60		
Output, y	1	կ	11		

- 9. (a) Each element of *A* is matched with exactly one element of *B*, so it does represent a function.
 - (b) The element 1 in A is matched with two elements, -2 and 1 of B, so it does not represent a function.
 - (c) Each element of *A* is matched with exactly one element of *B*, so it does represent a function.
 - (d) The element 2 in *A* is not matched with an element of *B*, so the relation does not represent a function.
- 10. (a) The element *c* in *A* is matched with two elements, 2 and 3 of *B*, so it is not a function.
 - (b) Each element of *A* is matched with exactly one element of *B*, so it does represent a function.
 - (c) This is not a function from *A* to *B* (it represents a function from *B* to *A* instead).
 - (d) Each element of *A* is matched with exactly one element of *B*, so it does represent a function.

11.
$$x^2 + y^2 = 4 \Box y = \pm 4 - x^2 \sqrt{1 + y^2}$$

No, *y* is not a function of *x*.

12.
$$x^2 - y = 9 \Box y = x^2 - 9$$

Yes, *y* is a function of *x*.

13.
$$y = 16 - x^2$$

Yes, *y* is a function of *x*.

14. $y = x \not \sqrt{5}$

Yes, *y* is a function of *x*.

15. y = 4 - x

Yes, *y* is a function of *x*.

16. y = -4 $x \square y = -4$ x or y = --(4 x)

No, *y* is not a function of *x*.

$$47. \qquad f x() = 5x^{2} + 2x - 1$$

Because f()x is a polynomial, the domain is all real numbers *x*.

48.
$$f()x = 1 - 2x^2$$

Because f()x is a polynomial, the domain is all real numbers *x*.

49.
$$g y(y) = y + 6$$

Domain: $y + 6 \ge 0$ $y \ge -6$

The domain is all real numbers \underline{y} such that $y \ge -6$.

50.
$$ft() \leq 3t + 4$$

53. $fs() = \frac{\sqrt{s-1}}{s-4}$

58. (a) The maximum profit is \$3375.

Domain:
$$s - 1 \ge 0 \square s \ge 1$$
 and $s \ne 4$

The domain consists of all real numbers *s*, such that $s \ge 1$ and $s \ne 4$.

54.
$$f x() = \frac{\sqrt{x+6}}{6+x_x}$$

$$x + 2 = 0 \square x = -2$$

$$x - 2 = 0 \square x = 2$$

x represents the principal square root.

Because f()t is a cube root, the domain is all real numbers t.

51.
$$g x() = \frac{1-3}{-x}x + 2$$

The domain is all real numbers x except x =0, x = -2.

52.
$$h x() = \underbrace{-}_{2} 6 x - 4x$$
$$x^{2} - 4x \neq 0$$
$$x x(-4) \neq$$
$$0 x \neq 0$$
$$x - 4 \neq 0 \square x \neq 4$$

The domain is all real numbers x except x = 0, x = 4.

(b) v

V is a function of x.

(c)
$$V = x(24 - 2x)^2$$

Domain: $0 < \langle x | 12$

(c) The dimensions that will maximize the volume of the package are $18 \times \times 18$ 36. From the graph, the maximum volume occurs when x = 18. To find the dimension for *y*, use the equation y = 108 - 4. *x*

y = 108 - 4x = 108 - 418() = 108 - 72 = 36

$$63. A = {}^{1}\overline{b}h = {}^{1}\overline{xy}$$

2 2

Because (0, y) (2, 2, 1) and (x, 0) all lie on the same line.

So,
$$A = \frac{1}{x} \frac{1}{2} \frac{1}{x} \frac{1}{2} \frac{1}{2} = \frac{1}{2(x-2)}$$
.

If the child holds a glove at a height of 5 feet, then the ball *will* be over the child's head because it will be at a height of 18.5 feet.

> **62.** (a) $V = l \cdot w \cdot h = x \cdot y \cdot x = x y^2$ where 4x + y = 108. So, y = 108 - 4x and $V = x^2(108 - 4x) = 108x^2 - 4x^3$. Domain: 0 < <x 27 (b) 12.000

equal.

64.
$$A = l \cdot w = (2xy) = 2xy$$

But $y = \sqrt{36 - x^2}$, so $A = 2x\sqrt{36 - x^2}$. The domain is $0 < < x$ 6.

65. For 2008 through 2011, use

$$p t() = 2.77t + 45.2.$$

2008: $p() 8 = 2.77 8() + 45.2 = 67.36\%$
2009: $p() 9 = 2.77 9() + 45.2 = 70.13\%$

2010: $p()10= 2.77 \ 10() + 45.2 = 72.90\%$ 2011: $p()11 = 2.77 \ 11() + 45.2 = 75.67\%$ For 2011 through 2014, use

p t() = 1.95t + 55.9.

2012: p()12 = 1.95 12() + 55.9 = 79.30%

2 □ x © 2018 Cengage Learning. All Rights Reserved. May not be scanned, copied or duplicated, or posted to a publicly accessible website, i The domain of A includes x-values such that

$$g x() = - x - 3$$

60. Parent function: $f()x = x^2$

Horizontal shift of 2 units to the right and a vertical shift of 4 units upward

$$g(x) = (x-2)^2 + 4$$

(b) $Hx() = 0.00004636x^3$

$$\begin{array}{ccccccc}
 H_{\Box} & _ \Box &= 0.00004636 \Box \Box & x \\
 \Box & \Box & x & _ & _ \\
 \Box & 1.6\Box & \Box & 1.6\Box \\
 & \Box & x^{3}\Box \\
 = 0.00004636\Box \Box \\
 & \Box & 4.096\Box \\
 = 0.0000113184x^{3} = 0.00001132x^{3}
\end{array}$$

 $\Box x \Box$

The graph of H^{\Box} — \Box is a horizontal stretch of the $\Box 1.6^{\Box}$ graph of H x().

62. (a) The graph of $N x() = -0.023(x - 33.12)^2 + 131$ is

a reflection in the *x*-axis, a vertical shrink, a horizontal shift 33.12 units to the right and a vertical shift 131 units upward of the parent graph $f()x = x^2$.

(b) The average rate of change from t = 0 to t = 14 is given by the following.

$$-N(-)14 - N(-)0 \approx 122.591 - 105.770$$

$$= \frac{16.821}{14}$$

$$\approx 1.202$$

The number of households in the United States increased by an average of 1.202 million or 1,202,000 households each year from 2000 to 2014.

(c) Let
$$t = 22$$
:

$$N(22) = -0.023 \ 22(-33.12)^2 + 131$$

$$\approx 128.156$$

In 2022, the number of households in the United States will be about 128.2 million households. Answers will vary. *Sample answer:* Yes, because the number of households has been increasing on average.

= f(-x) is a reflection in the y-axis. 64. 63. False. y

False. y = -fx() is a reflection in the *x*-axis.

- 65. True. Because x = |-x|, the graphs of fx() = x + 6 and fx() = -x + 6 are identical.
- 66. False. The point (-2, -61) lies on the transformation.
- **67.** y = fx(+2) 1

Horizontal shift 2 units to the left and a vertical shift 1 unit downward

$$(0,1) \rightarrow (0-2,1-=-1)(2,0)$$
$$(1,2) \rightarrow -(1 2,2-=-1)(1,1)$$
$$(2,3) \rightarrow (2-2,3-=1) (0,2)$$

- **68.** (a) Answers will vary. Sample answer: To graph f(x)
 - = $3x^2 4x$ + 1use the point-plotting method since it is not written in a form that is easily identified by a sequence of translations of the parent function $y = x^2$.

(b) Answers will vary. Sample answer: To graph f(x)= $2(x - 1)^2$ - 6 use the method of translating

the parent function $y = x^2$ since it is written in a form such that a sequence of translations is easily identified.

69. Since the graph of g()x is a horizontal shift one unit to

the right of $f(x) = x^3$, the equation should be

$$g x() = (x - 1)^3$$
 and not $g x() = (x + 1)^3$

71. (a) The profits were only $\frac{3}{4}$ as large as expected: 72. No. $g(x) = -x^4 - 2$. Yes. $h(x) = -(x - 3)^4$

$$g()t = \frac{3}{4}ft()$$

- (b) The profits were \$10,000 greater than predicted: g t() = f t() + 10,000
- (c) There was a two-year delay: g t() = f t(-2)
- 1. addition; subtraction; multiplication; division

$$x + 2$$
, 1016

59. (a)
$$c t() = b t () p t - () d t \times 100$$

(b) c()16 represents the percent change in the population due to births and deaths in the year 2016.

60. (a)
$$p t() = d t() + c t()$$

(b) p()16 represents the number of dogs and cats in 2016.

(c)
$$h t() = n tp t() = d t n t() + c t$$

 $= 90t^2 + 60t + 600$

$$= 30 3 (t^2 + 2t + 20), \quad 0 \le t \le 6$$

This represents the number of bacteria in the food as a function of time.

(b) Use t = 0.5.

$$NT((0.5)) = 30 \ 3 \ 0.5(()^2 + 2 \ 0.5() + 20) = 652.5$$

After half an hour, there will be about 653 bacteria.

(c)
$$30 3(t^2 + 2t + 20) = 1500$$

 $3t^2 + 2t + 20 = 50$
 $3t^2 + 2t - 30 = 0$

By the Quadratic Formula, $t \approx -3.513$ or 2.846. Choosing the positive value for *t*, you have $t \approx 2.846$ hours.

63. (a)
$$fg x(()) = f(0.03x) = 0.03x - 500,000$$

(b)
$$g f x(()) = g x(-500,000) = 0.03(x - 500,000) g(f x())$$

represents your bonus of 3% of an amount over \$500,000.

(b) Sp() = 0.9p the cost of the car with the dealership discount.

 $(S \square R p)() = S p(-2000) = 0.9(p - 2000) = 0.9p -$

h t() represents the number of dogs and 64. (a) R p() = p - 2000 the cost of the car after the factory rebate. cats per capita.

1800

61. (a)
$$r x() = -x$$

2 (c) $(R \boxtimes S)()p = R(0.9p) = 0.9p - 2000$

(b)
$$A()r = \pi r^2$$

(c)
$$(A \boxtimes r x)() = A r x(()) = A \square \square \square \square$$

 $\square \square \square \square \square \square \square \square \square \square 2x 2$

(R $\square S$)()*p* represents the factory rebate *after* the dealership discount.

(S $\mathbb{B} R$)() p represents the dealership discount after $(A \mathbb{B} r)$ () x represents the area of the circular base of the factory rebate.

$$\begin{array}{rcl} x. & (d) & (R \boxtimes S)()p & = (R \boxtimes S)(20,500) \\ & = 0.9\ 20,500() - 2000 = \$16,450 \\ & (S \boxtimes R)()p & = (S \boxtimes R)(20,500) = 0.9\ 20,500() \\ & = 10\ 9(\ t^2 + 12t + 4) - 60t - 40 + 600 \end{array}$$

62. (a) NTt(()) = N(3t + 2)= 10 3(t + 2)² - 20

600
- 1800 = \$16,650

 $(R \ S)(20,500)$ yields the lower cost because 10% of the price of the car is more than \$2000.

65. False. $(f \square g)()x$ = 6x + 1 and $(g \square f)(69$. Let f(x) and g(x) be two odd functions and define h(x) = f(x)g(x)x = 6x + 6). Then

h(-x) = f(-xg)(-x)

66. True. $(f \square g c)()$ is defined only when g()c is

in the domain of *f*.

67. Let O = oldest sibling, M = middle sibling,

Y = youngest sibling.

Then the ages of each sibling can be found

using the equations:

O = 2M $M = \frac{1}{2}Y + 6$

68. (a) *Y M O* Answers will vary.

(a) $OMY(()) = 2(\frac{1}{2})Y + 6 = 12 + Y;$ Answers will vary.

()) = $2\binom{1}{2}O$ - 12 = O - 12;

(b) Youngest sibling is $2 \rightarrow Y = 2$ Middle

 $M = \frac{1}{2}()2 + 6$ M = 7 years old

O = 14 years old

sibling: $M = \frac{1}{2}Y + 6$

Oldest sibling: O = 2M

O = 27()

(b) Oldest sibling is 16: O = 16

Middle sibling: O = 2M

$$g = f x g x() () = h x().$$

So, $h x()$ is even.

 $= \Box \Box - f x() \Box \Box \Box \Box - g x() \Box \Box$

Let f(x) and g(x) be two even functions and define h(x) = f(x)g(x). Then

because and are oddf

$$f(x = -x)f(x = g)(-x)$$

$$= f x g x()(x) \text{ because and are even} f(x = y) = h x(x)$$

70. Let f()x be an odd function, g()x be an even function, and define hx()

$$16 = 2M$$
) $= fx g x() ()$. Then $M = 8$ years old $h(-x) = f(-x g) (-x)$ Youngest sibling: $M = \frac{1}{2}Y + 6$ $= \Box \Box - fx()\Box \Box g x()$ because is odd and is even $fg = -fx g$ $8 = \frac{1}{2}Y + 6$ $x() () = -hx()$. $2 = \frac{1}{2}Y$ So, h is odd and the product of an odd function and an even function is odd.

71. (a) Answer not unique. Sample answer: f(x) = x + 3, g(x) = x + 2

$$(f \square g x)() = f g x(()) = (x + + = +2) 3 x 5 (g \square f)() x = g f$$

 $x(()) = (x + + = +3) 2 x 5$

 $x = 0.03y^2 + 245.50$

 $= 0.03y_2$

= y₂

wage,
$$y =$$
 number of units produced

(b)
$$y = ____2 24.25 - 10 = 19$$

0.75

So, 19 units are produced.

90. (a)

- 91. False. $f()x = x^2$ is even and does not have an inverse.
- 92. True. If f()x has an inverse and it has a y-intercept at
 - (0, b), then the point (b, 0,) must be a point on the

graph of
$$f^{-1}()x$$
.

93.	x	1		4	8			
	f	1		6	$\frac{7}{2}$			
	x		1	2	6	7	_	
94.	x	-4		-2	0	3		
	f	3		4	0	-1		

The graph does not pass the Horizontal Line Test, so

$$f^{-1}()x$$
 does not exist.

95. Let
$$(f \square g)()x = y$$
. Then $x = (f \square g)()^{-1}y$. Also,

x = temperature in degrees Fahrenheit

≻ *x*

f()xand f

$$(f \boxtimes g x)() = y \Box f g x() = y$$

 $g x() = f^{-1}()y x$
 $= g^{-1}(f^{-1})y$
 $) x = (g^{-1} \boxtimes f^{-1})()y$.

$$k = 12\underline{3} = \underline{14}.$$

So,
$$k = \frac{1}{4}$$
.

98.

99.

the domain of f is equal to the range of f^{-1} and the

range of f is equal to the domain of f^{-1} .

Because f and g are both one-to-one functions,

$$(f \mathbb{P} g)_{-1} = g_{-1} \mathbb{P} f_{-1}.$$

96. Let f()x be a one-to-one odd function. Then f

- ⁻¹()x exists and f(-x) = -fx(). Letting (x,
- y) be any point on the graph of $f()x\Box(-x, -x)$
- y) is also on the graph of f()x and $f^{-1}(- = -$

$$= -y$$
) $x f^{-1}()y$. So, $f^{-1}()x$ is

also an odd function.

97. If f ()x =
$$k(2 - x - x^3)$$
 has an inverse and f

$$^{-1}()3 = -2$$
, then $f(-2) = 3$. So,

$$f(-2) = k(2 - -(2) - -(2)^3) = 3$$

k(2 + 2 + 8) =
3 12k
= 3

Review Exercises for	
Chapter 2 ²	

 $^{-1}$ ()*x* are inverses of each other.

There is an inverse function $f^{-n}(x) = x - 1$ because **100.** (a) Cx(x) is represented by graph *m* and

- $C^{-1}()x$ is represented by graph *n*.
- (b) C x() represents the cost of making x units of

personalized T-shirts. $C^{-1}()x$ represents the

number of personalized T-shirts that can be made for a given cost.

- **101.** This situation could be represented by a one-to-one function if the runner does not stop to rest. The inverse function would represent the time in hours for a given number of miles completed.
- **102.** This situation cannot be represented by a one-to-one function because it oscillates.

37. $f_{x}(1) = -x^{2} + 8x - 4f(\Delta 4 - f(\Delta ^{0} - 12 - (-4)^{2} = 4)$
38. $f_{x}(1) = x^{3} + 2x + 1$
39. $f_{x}(1) = x^{3} + 4x - 7$
 $f(-x) = (-x)^{3} + 4(-x) - 7$
 $= -x^{2} - 4x - 7$
 $f_{x}(f_{x})$
39. $f_{x}(1) = x^{3} - 4x - 7$
 $f_{x}(1)$
31. $f(-x) = x^{2} - 3$
32. $f(-x) = x^{2} - 3$
33. $f(-x) = x^{2} - 4x - 7$
 $f_{x}(x)$
 $f(-x) = 2(x^{2} - x)$
33. $(x) = 1 \text{ to } x_{2} = 3$
34. $f(-x) = 2(-x)^{2} - (-x)^{2} + 4(-x) - 7$
 $= -x^{2} - 4x - 7$
 $f_{x}(-x) = -2x - \sqrt{x^{2} + 3}$
 $f(-x) = 2(-x)\sqrt{(-x)^{2} + 3}$

The function is odd, so the graph has origin symmetry.

42.
$$f x() = \frac{\sqrt[5]{6x^2}}{\sqrt[5]{6(-x)^2}} = \sqrt[5]{6x^2} = f(-x) = fx()$$

44. (a) f()0 = -5, f()4 = -8

) = $\sqrt{x^2 + 1}$ Domain: all real numbers

(b) $(g \mathbb{Z}f)()x = g f x(())$ = $g(\sqrt{x+1})$ = $(\sqrt{x+1})^2$

= x + 1

62. $f()x = x \sqrt{1, gx}() = x^2$

6

Domain: all real numbers *x* such that $x \ge -1$

In Exercises 63-64 use the following functions. f x() = x - 100, g x() = 0.95x

- 63. $(f \square g)()x = f(0.95x) = 0.95x 100$ represents the sale price if first the 5% discount is applied and then the \$100 rebate.
- 64. $(g \supseteq f)()x = g x(-100) = 0.95(x 100) = 0.95x 95$ represents the sale price if first the \$100 rebate is applied and then the 5% discount.
- 65. f x() = x 4 5 y = x 4 5 x = y 4
 - 5 5x = y 4 y = 5x + 4

So, $f^{-1}()x = 5x + 4$.

$$f f(-1)(x) = f(5x + 4) = 5x + 4 - 4 = 5x = x$$

$$f_{-1}(f_x()) = f_{-1} \Box \Box x - 4 \Box \Box = 5 \Box \Box x - 4 \Box \Box + 4 = x - 4 + 4 = x$$
$$\Box 5 \Box \Box 5 \Box$$

66. $fx() = x^3 - 1$ 67. $fx() = (x - 1)^2$

 $y = x_3 - 1$ No, the function does not have an inverse because the $x = y^3 - 1$ horizontal line test fails.

Let f(x) = 2(x)

68. ht() = 2t - 3

Yes, the function has an inverse because no horizontal lines intersect the graph at more than one point. The function has an inverse.

(c) The graph of f^{-1} is the \int_{-10}^{0}

reflection of the graph of f in the line y = x.

(d) The $\sqrt{x + 1}$ domains and ranges of f and f^{-1} are the set $\sqrt{x + 1}$ of all real numbers. 70. (a) $f x() = \frac{\sqrt{y + 1}}{1}$ y = x =

> $x^{2} = +y x^{2} - =1 y f^{-1} ()x = x^{2} - 1, x$ ≥ 0

Note: The inverse must have a restricted domain.

(c) The graph of f^{-1} is the reflection of the graph of f in the line y = x.

$$(-4)^{2}, x > 4 \text{ and}$$

$$y > 0, y = 2(x - 4)^{2}x = 2(y - 4)^{2}, x > 0, y > 4$$

$$x = 2(y - 4)^{2}, x > 0, y > 4$$

$$x = y - 4$$

$$\sqrt{\frac{2}{2}}$$

$$x = y - 4$$

$$x = y - 4$$

$$f^{-1}()x \quad \sqrt{=2} 4, x > 0$$

 $\frac{x}{2} + 4$

= y

72.
$$f x() = |x| - 2$$
 is
increasing on $(2, \infty)$.

Let
$$f(x) = x - 2, x > 2, y > 0$$

 $y = x - 2, x = y - 2,$

$$x > 0, y > 2$$

$$x + 2 = y$$

$$x, > 0, y$$

$$> 2 f^{-1}()$$

$$x = x + 2$$

$$2, x > 0$$

73. False. The graph is reflected in the *x*-axis, shifted 9 units to the left, then shifted 13 units downward.

3 6 9

_ y

3

-12 -9 -6 -3

⁽d) The domain of f and the range of f^{-1} is $[-1, \infty)$.

The range of f and the domain of f^{-1} is $[0, \infty)$.

71. $f(x) = 2(x - 4)^2$ is increasing on $(4, \infty)$.

74. True. If $f(x) = x^3$ and $g(x) = x^3$, then the domain of g is all real numbers, which is equal to the range of f and vice versa

Problem Solving for Chapter 2

1. (a) $W_1 = 0.07S + 2000$ (b) $W_2 = 0.05S + 2300$

Point of intersection: (15,000, 3050)

Both jobs pay the same, \$3050, if you sell \$15,000 per month.

- (d) No. If you think you can sell \$20,000 per month, keep your current job with the higher commission rate. For sales over \$15,000 it pays more than the other job.
- **2.** Mapping numbers onto letters is *not* a function. Each number between 2 and 9 is mapped to more than one letter.

$$\{(2, A), (2, B), (2, C), (3, D), (3, E), (3, F), (4, G), (4, H), (4, I), (5, J), (5, K), (5, L), (5, R), (5,$$

(6, M) (, 6, N) (, 6, O) (, 7, P) (, 7, Q) (, 7, R) (, 7, S) (, 8, T) (, 8, U) (, 8, V) (, 9, W) (, 9, X) (, 9, Y) (, 9, Z)Mapping letters onto numbers *is* a function. Each letter is only mapped to one number.

$$\{(A, 2,), (B, 2,), (C, 2,), (D, 3,), (E, 3,), (F, 3,), (G, 4,), (H, 4,), (I, 4,), (J, 5,), (K, 5,), (L, 5,), (L,$$

(M, 6,) (N, 6,) (O, 6,) (P, 7,) (Q, 7,) (R, 7,) (S, 7,) (T, 8,) (U, 8,) (V, 8,) (W, 9,) (X, 9,) (Y, 9,) (Z, 9)

3. (a) Let f(x) and g(x) be two even functions.

(b) Let f(x) and g(x) be two odd functions.

Then define
$$h x() = f x() \pm g x()$$
.
 $h(- = - \pm -x)f(x) = g(x)$
 $= f x() \pm g x()$ because and are evenf
 $g = h x()$

Then define
$$h x() = f x() \pm g x()$$
.
 $h(- = - \pm -x)f(x)$
 $g(x)$

 $= -f x() \pm g x() \text{ because and are odd} f$ g = -h x()

So, h x() is also even.

So, h x() is also odd. (If $f()x \neq g x()$)

(c) Let f()x be odd and g()x be even. Then define $hx() = fx() \pm gx()$.

$$h(- = - \pm -x)f(x) \qquad g(x)$$

= - f x() ± g x() because is odd and is evenf g
\$\neq h x()\$
\$\neq -h x()\$

So, h x() is neither odd nor even.

$$(f \bowtie f)()x = x \operatorname{and}(g \bowtie g)()x = x$$

These are the only two linear functions that are their own inverse functions since m has to equal/ $\ln m$ for this to be true.

General formula:
$$y = - +x c$$

5.
$$f x() = a x_{2n} x_{2n} + a_{22n-} x_{22n-} + 2 + a x_{22} + a_0 f(-=x)$$

 $a_{2n}(-x)_{2n} + a_{22n-} (-x)_{22n-} + 2 + a_2(-x)_{22n-} + a_0 = a x_{2n-} x_{22n-} + 2 + a x_{22} + a_0 = f x()$
So, $f()x$ is even.
^{8 ft}

.

6. It appears, from the drawing, that the triangles are equal; thus

(x y,) = (6, 8.)

The line between (2.5, 2) and (6, 8 is) $y = \frac{12}{7}x - \frac{16}{7}$.

The line between (9.5, 2) and (6, 8 is) $y = -\frac{12}{7}x + \frac{128}{7}$.

The path of the ball is:

$$f_{x} = \frac{2.5 \le x \le 6}{12} \prod_{12}^{x} + \frac{128}{7}, \quad 6 < x \le 9.5$$

$$f_{x} = \frac{12}{7} \prod_{7}^{x} - \frac{128}{7}, \quad () = \frac{1}{7} \prod_{7}^{x} - \frac{1}{7} \int (1)^{2} - f(1)^{2} = 1 = 0 = 1$$

$$f(1.5) - f(1)^{1} = 0.75 - 0 = 1.5$$

$$1.5 - 1 \quad 0.5$$

$$f(1.25) - f(1)^{1} = 0.75 - 0 = 1.5$$

$$1.5 - 1 \quad 0.5$$

$$f(1.25) - f(1)^{1} = 0.4375 - 0$$
7. (a) April 11: 10 hours

Practice Test for Chapter 2

- **1.** Find the equation of the line through (2, 4 and) (3, -1.)
- 2. Find the equation of the line with slope m = 4.3 and y-intercept b = -3.
- **3.** Find the equation of the line through (4,1 perpendicular to the line) 2x + 3y = 0.
- **4.** If it costs a company \$32 to produce 5 units of a product and \$44 to produce 9 units, how much does it cost to produce 20 units? (Assume that the cost function is linear.)
- 5. Given $f x() = x^2 2x + 1$, find f x(-3).

()
$$fx() - f()3$$

6. Given $fx = 4x - 11$, find $x - 3$

- 7. Find the domain and range of $f()x = 36 x^2$.
- 8. Which equations determine *y* as a function of *x*?
 - (a) 6x 5y + 4 = 0
 (b) x² + y² = 9 (c) y³ = x² + 6
- **9.** Sketch the graph of $f(x) = x^2 5$. **10.** Sketch the graph of f(x) = x + 3.

11. Sketch the graph
$$f(x) = \begin{cases} 2x + 1, & \text{if } x \ge 0, \\ 2 & \text{of } \Box x - x, \text{ if } x < 0. \end{cases}$$

- **12.** Use the graph of f()x = x to graph the following:
 - (a) fx(+2)
 - (b) -fx() + 2
- **13.** Given f(x) = 3x + 7 and $g(x) = 2x^2 5$, find the following:
 - (a) (g f)()x
 - (b) (fg)()x
- 14. Given $f(x) = x^2 2x + 16$ and g(x) = 2x + 3, find f(g(x)).
- **15.** Given $f x() = x^3 + 7$, find $f^{-1}()x$.

16. Which of the following functions have inverses?

0

(a)
$$fx() = |x - 6|$$

(b) $fx() = ax + b a$, \neq
(c) $fx() = x^3 - 19$
Practice Test for Chapter 2

17. Given
$$f(x) = \sqrt{\frac{3 \pm x}{x}}, 0 < x \le 3$$
, find $f^{-1}(x)$.

Exercises 18–20, true or false?

18.
$$y = 3x + 7$$
 and $y = \frac{1}{3x} - 4$ are perpendicular.

19.
$$(f \square g)^{-1} = g^{-1} \square f^{-1}$$

20. If a function has an inverse, then it must pass both the Vertical Line Test and the Horizontal Line Test.

Find the slope of a line given two points on the line.

- Write linear equations in two variables.
- Use slope to identify parallel and perpendicular lines.
- Use slope and linear equations in two variables to model and solve real-life problems.

The simplest mathematical model for relating two variables is the **linear equation in two variables** y = mx + b.

The equation is called *linear* because its graph is a line. (In mathematics, the term *line* means *straight line*.)

By letting x = 0, you obtain

$$y = m(0) + b$$
$$= b.$$

So, the line crosses the *y*-axis at y = b, as shown in the figures below.

Positive slope, line rises. Negative slope, line falls. In other words, the *y*-intercept is (0, b).

The steepness or slope of the line is *m*.

The **slope** of a nonvertical line is the number of units the line rises (or falls) vertically for each unit of horizontal change from left to right, as shown below.

Positive slope, line rises. Negative slope, line falls. A linear equation written in **slope-intercept form** has the form y = mx + b.

The Slope-Intercept Form of the Equation of a Line

The graph of the equation

y = mx + b

is a line whose slope is m and whose y-intercept is (0, b).

Once you have determined the slope and the *y*-intercept of a line, it is a relatively simple matter to sketch its graph. In the next example, note that none of the lines is vertical.

A vertical line has an equation of the form

X = a. Vertical line

The equation of a vertical line cannot be written in the form y = mx + b because the slope of a vertical line is undefined, as indicated in Figure 2.1. Slope is undefined.

Figure 2.1

(3, 5)

(3, 1)

x = 3

5-

3

2 -

Sketch the graph of each linear equation.

a. y = 2x + 1 **b.** y = 2 **c.** x + y = 2

Because b = 1, the *y*-intercept is (0, 1).

Solution

Moreover, because the slope is m = 2, the line *rises* two units for each unit the line moves to the right.

When *m* is positive, the line rises.

By writing this equation in the form y = (0)x + 2, you can see that the *y*-intercept is (0, 2) and the slope is zero.

A zero slope implies that the line is horizontal—that is, it does not rise *or* fall.

Solution

When m is 0, the line is horizontal.

By writing this equation in slope-intercept form

Solution

x + y = 2 Write original equation. y = -x + 2

Subtract x from each side.

y = (-1)x + 2 Write in slopeintercept form.

you can see that the *y*-intercept is (0, 2). Moreover, because the slope is m = -1, the line *falls* one unit for each unit the line moves to the right.

When *m* is negative, the line falls.

Finding the Slope of a Line

Given an equation of a line, you can find its slope by writing the equation in slope-intercept form. If you are not given an equation, then you can still find the slope of a line.

For instance, suppose you want to find the slope of the line passing through the points (x_1, y_1) and (x_2, y_2) , as shown

As you move from left to right along this line, a change of $(y_2 - y_1)$ units in the vertical direction corresponds to a change of $(x_2 - x_1)$ units in the horizontal direction.

 $y_2 - y_1$ = the change in y = rise and $x_2 - x_1$ = the change in x = run

The ratio of $(y_2 - y_1)$ to $(x_2 - x_1)$ represents the slope of the line that passes through the points (x_1, y_1) and (x_2, y_2) .

Slope =
$$\frac{\text{change in } y}{\text{change in } x}$$

= $\frac{\text{rise}}{\text{run}}$
= $\frac{y_2 - y_1}{x_2 - x_1}$

The Slope of a Line Passing Through Two Points

The **slope** *m* of the nonvertical line through (x_1, y_1) and (x_2, y_2) is

$$m = \frac{y_2 - y_1}{x_2 - x_1}$$

where $x_1 \neq x_2$.

When using the formula for slope, the *order of subtraction* is important. Given two points on a line, you are free to label either one of them as (x_1, y_1) and the other as (x_2, y_2) .

However, once you have done this, you must form the numerator and denominator using the same order of subtraction.

For instance, the slope of the line passing through the points (3, 4) and (5, 7) can be calculated as

$$m = \frac{7-4}{5-3} = \frac{3}{2}$$

or, reversing the subtraction order in both the numerator and denominator, as

$$m = \frac{4-7}{3-5} = \frac{-3}{-2} = \frac{3}{2}.$$

Example 2(a) – Solution

Find the slope of the line passing through each pair of points.

- **a.** (-2, 0) and (3, 1)
- **b.** (-1, 2) and (2, 2)
- **c.** (0, 4) and (1, -1)
- **d.** (3, 4) and (3, 1)

Example 2(a) – Solution

cont'd

Letting $(x_1, y_1) = (-2, 0)$ and $(x_2, y_2) = (3, 1)$, you obtain a slope of

Figure 2.2

cont'd

The slope of the line passing through (-1, 2) and (2, 2) is

Figure 2.3

cont'd

The slope of the line passing through (0, 4) and (1, -1) is

Figure 2.4

The slope of the line passing through (3, 4) and (3, 1) is

$$m = \frac{1-4}{3-3}$$
$$= \underbrace{-3}_{0}$$

Because division by 0 is undefined, the slope is undefined and the line

is vertical.

Figure 2.5

Writing Linear Equations in Two Variables

If (x_1, y_1) is a point on a line of slope *m* and (x, y) is *any other* point on the line, then

$$\frac{y-y_1}{x-x_1} = m.$$

This equation involving the variables *x* and *y*, rewritten in the form $y - y_1 = m(x - x_1)$ is the **point-slope form** of the equation of a line.

Point-Slope Form of the Equation of a Line

The equation of the line with slope *m* passing through the point (x_1, y_1) is

$$y - y_1 = m(x - x_1).$$

The point-slope form is most useful for *finding* the equation of a line.

Find the slope-intercept form of the equation of the line that has a slope of 3 and passes through the point (1, -2).

Solution:

Use the point-slope form with m = 3 and $(x_1, y_1) = (1, -2)$.
$$y - y_1 = m(x -$$

$$x_1) y - (-2) = 3(x)$$

Substitute for
$$m$$
, x_1 and

<u>ر</u> (- 1

y1.

$$y + 2 = 3x - 3$$
Simplify. $y = 3x - 5$ Write in slope-intercept form.

The slope-intercept form of the equation of the line is y = 3x - 5.

Figure 2.6 shows the graph of this equation.

Figure 2.6

The point-slope form can be used to find an equation of the line passing through two points(x_1 , y_1) and (x_2 , y_2). To do this, first find the slope of the line

$$m = \frac{y_2 - y_1}{x_2 - x_1}, \quad x_1 \neq x_2$$

and then use the point-slope form to obtain the equation

$$y - y_1 = \frac{y_2 - y_1}{x_2 - x_1}(x - x_1).$$

Two-point form

This is sometimes called the **two-point form** of the equation of a line.

Parallel and Perpendicular Lines

Slope can tell you whether two nonvertical lines in a plane are parallel, perpendicular, or neither.

Parallel and Perpendicular Lines

1. Two distinct nonvertical lines are **parallel** if and only if their slopes are equal. That is,

$$m_1 = m_2.$$

2. Two nonvertical lines are **perpendicular** if and only if their slopes are negative reciprocals of each other. That is,

$$m_1 = \frac{-1}{m_2}.$$

Find the slope-intercept form of the equations of the lines that pass through the point (2, -1) and are (a) parallel to and

(b) perpendicular to the line 2x - 3y = 5.

Solution:

By writing the equation of the given line in slope-intercept form

$$2x - 3y = 5$$

$$-3y = -2x + 5$$

Write original equation. Subtract 2x

from each side.

cont'd

$$y = \frac{2}{3}x - \frac{5}{3}$$

Write $\frac{2}{3}$ slope-intercept form.
it has a slope of

40

m =, as shown in Figure 2.7.

Figure 2.7

Any line parallel to the given line must also have a slope of $\frac{2}{3}$.

cont'd

So, the line through (2, -1) that is parallel to the given line has the following equation. Multiply each side by 3.

$$y - (-1) = \frac{2}{3}(x - 2)$$

$$3(y + 1) = 2(x - 2)$$

$$3y + 3 = 2x - 4$$

$$y = \frac{2}{3}x - \frac{7}{3}$$

Distributive Property

Write in slope-intercept form.

Write in point-slope form.

cont'd Wri te in poi y line perpendicular to the given line must have a nt- $(be-\frac{3}{2})$ is the negative reciprc²/₃;al of $-\frac{3}{2}$ of)._{slo} pe , the line through (2, -1) that is perpendicular to the for ven line has the following equation. m. y - (-1) = (x - 2)Mu Itiply each side by 2. 2(y + 1) = -3(x - 2)**Distributive Property** 2y + 2 = -3x + 6 $y = -\frac{3}{2}x + 2$ Write in slope-intercept form.

Notice in Example 4 how the slope-intercept form is used to obtain information about the graph of a line, whereas the point-slope form is used to write the equation of a line.

In real-life problems, the slope of a line can be interpreted as either a *ratio* or a *rate*.

If the *x*-axis and *y*-axis have the same unit of measure, then the slope has no units and is a **ratio**.

If the *x*-axis and *y*-axis have different units of measure, then the slope is a **rate** or **rate of change**.

The maximum recommended slope of a wheelchair ramp is $\frac{1}{12}$ business is installing a wheelchair ramp that rises 22 inches over a horizontal length of 24 feet. Is the ramp steeper than recommended?

The horizontal length of the ramp is 24 feet or 12(24) = 288 inches, as shown below.

Slope
$$= \frac{\text{vertical change}}{\text{horizontal change}}$$

So, the slope of the ramp is

$$=\frac{22 \text{ in.}}{288 \text{ in.}}$$

$\approx 0.076.$

Because $\frac{1}{12} \approx 0.083$, the slope of the ramp is not steeper than recommended.

The sales for Best Buy were approximately \$49.7 billion in 2009 and \$50.3 billion in 2010. Using only this information, write a linear equation that gives the sales in terms of the year. Then predict the sales in 2013.

Let t = 9 represent 2009. Then the two given values are represented by the data points (9, 49.7) and (10, 50.3).

The slope of the line through these points is

$$m = \frac{50.3 - 49.7}{10 - 9} = 0.6$$

You can find the equation that relates the sales *y* and the year *t* to be

$$y - 49.7 = 0.6(t - 9)$$
 Write in point-slope form.

$$y = 0.6t + 44.3$$
.

Write in slope-intercept form.

According to this equation, the sales

for 2013 will be y = 0.6(13) + 44.3

$$= 7.8 + 44.3$$

= \$52.1 billion. (See Figure 2.10.)

Figure 2.10

The prediction method illustrated in Example 8 is called **linear** extrapolation.

Note in Figure 2.11 that an extrapolated point does not lie between the given points.

When the estimated point lies Figure 2.11 between two given points, as shown in

Figure 2.12, the procedure is called **linear interpolation**.

Linear interpolation Figure 2.12

Because the slope of a vertical line is not defined, its equation cannot be written in slope-intercept form.

However, every line has an equation that can be written in the **general form**

Ax + By + C = 0

where A and B are not both zero.

Summary of Equations of Lines

- **1.** General form: Ax + By + C = 0
- **2.** Vertical line: x = a
- **3.** Horizontal line: y = b
- **4.** Slope-intercept form: y = mx + b
- 5. Point-slope form: $y y_1 = m(x x_1)$
- 6. Two-point form: $y y_1 = \frac{y_2 y_1}{x_2 x_1}(x x_1)$

Functions and Their Graphs

- Determine whether relations between two variables are functions, and use function notation.
- Find the domains of functions.
- Use functions to model and solve real-life problems.

Evaluate difference quotients.

Introduction to Functions and Function Notation

Many everyday phenomena involve two quantities that are related to each other by some rule of correspondence. The mathematical term for such a rule of correspondence is a **relation.**

In mathematics, equations and formulas often represent relations.

For instance, the simple interest *I* earned on \$1000 for 1 year is related to the annual interest rate *r* by the formula *I* = 1000r.

The formula I = 1000r represents a special kind of relation that matches each item from one set with *exactly one* item from a different set. Such a relation is called a **function**.

Definition of Function

A function f from a set A to a set B is a relation that assigns to each element x in the set A exactly one element y in the set B. The set A is the **domain** (or set of inputs) of the function f, and the set B contains the **range** (or set of outputs).

To help understand this definition, look at the function below, which relates the time of day to the temperature.

Time of day (P.M.)

Temperature (in °C)

Set *A* is the domain. Set *B* contains the range. Inputs: 1, 2, 3, 4, 5, 6 Outputs: 9, 10, 12, 13, 15

The following ordered pairs can represent this function. The first coordinate (*x*-value) is the input and the second coordinate (*y*-value) is the output.

$\{(1, 9), (2, 13), (3, 15), (4, 15), (5, 12), (6, 10)\}$

Characteristics of a Function from Set A to Set B

- 1. Each element in A must be matched with an element in B.
- 2. Some elements in *B* may not be matched with any element in *A*.
- 3. Two or more elements in A may be matched with the same element in B.
- **4.** An element in *A* (the domain) cannot be matched with two different elements in *B*.

Four common ways to represent functions are as follows.

Four Ways to Represent a Function

- **1.** *Verbally* by a sentence that describes how the input variable is related to the output variable
- 2. *Numerically* by a table or a list of ordered pairs that matches input values with output values
- **3.** *Graphically* by points on a graph in a coordinate plane in which the horizontal axis represents the input values and the vertical axis represents the output values
- 4. Algebraically by an equation in two variables

To determine whether a relation is a function, you must decide whether each input value is matched with exactly one output value.

When any input value is matched with two or more output values, the relation is not a function.

Determine whether the relation represents *y* as a function of *x*.

a. The input value *x* is the number of representatives from a state, and the output value *y* is the number of senators.

a. This verbal description *does* describe *y* as a function of *x*.
Regardless of the value of *x*, the value of *y* is always 2. Such functions are called *constant functions*.

b. This table *does not* describe *y* as a function of *x*. The input value 2 is matched with two different *y*-values.

c. The graph *does* describe *y* as a function of *x*. Each input value is matched with exactly one output value.
Representing functions by sets of ordered pairs is common in *discrete mathematics*.

In algebra, however, it is more common to represent functions by equations or formulas involving two variables.

For instance, the equation

$$y = x^2$$
 y is a function of x.

represents the variable *y* as a function of the variable *x*. In this equation, *x* is the **independent variable** and *y* is the **dependent variable**.

The domain of the function is the set of all values taken on by the independent variable *x*, and the range of the function is the set of all values taken on by the dependent variable *y*.

When using an equation to represent a function, it is convenient to name the function for easy reference.

For example, you know that the equation $y = 1 - x^2$ describes *y* as a function of *x*.

Suppose you give this function the name "*f*." Then you can use the following **function notation.**

Input	Output	Equation
X	$f(\mathbf{x})$	$f(x)=1-x^2$

The symbol f(x) is read as *the value of f at x* or simply *f of x*. The symbol f(x) corresponds to the *y*-value for a given *x*. So, you can write y = f(x).

Keep in mind that *f* is the *name* of the function, whereas f(x) is the *value* of the function at *x*.

For instance, the function f(x) =

$$3 - 2x$$

has *function values* denoted by f(-1), f(0), f(2), and so on. To find these values, substitute the specified input values into the given equation.

For x = -1, f(-1) = 3 - 2(-1) = 3 + 2 = 5.

For x = 0, f(0) = 3 - 2(0) = 3 - 0 = 3.

For x = 2, f(2) = 3 - 2(2) = 3 - 4 = -1. Although *f* is often used as a convenient function name and *x* is often used as the independent variable, you can use other letters. For instance, $f(x) = x^2 - 4x + 7$, $f(t) = t^2 - 4t + 7$, and $g(s) = s^2 - 4s + 7$

all define the same function. In fact, the role of the independent variable is that of a "placeholder." Consequently, the function could be described by $f(-) = (-)^2 - 4(-) + 7$.

A function defined by two or more equations over a specified domain is called a **piecewise-defined function**.

Evaluate the function when x = -1, 0, and 1. $f(x) = \begin{cases} x^2 + 1, & x < 0 \\ x - 1, & x \ge 0 \end{cases}$

Solution:

Because x = -1 is less than 0, use $f(x) = x^2 + 1$ to obtain

$$f(-1) = (-1)^2 + 1 = 2.$$

For x = 0, use f(x) = x - 1 to obtain

$$f(0) = (0) - 1 = -1.$$

For x = 1, use f(x) = x - 1 to obtain

f(1) = (1) - 1= 0. The Domain of a Function

The domain of a function can be described explicitly or it can be *implied* by the expression used to define the function.

The **implied domain** is the set of all real numbers for which the $f(x) = \frac{1}{x^2 - 4}$ expression is defined. For instance, the function

Domain excludes x-values that result in division by zero.

has an implied domain consisting of all real x other than $x = \pm 2$.

These two values are excluded from the domain because division by zero is undefined.

Another common type of implied domain is that used to avoid

$$f(x) = \sqrt{x}$$
 even roots of negative numbers. For example, the function

Domain excludes *x*-values that result in even roots of negative numbers.

is defined only for $x \ge 0$. So, its implied domain is the interval $[0, \infty)$.

In general, the domain of a function *excludes* values that would cause division by zero *or* that would result in the even root of a negative number.

Find the domain of each function.

a. *f*: {(-3, 0), (-1, 4), (0, 2), (2, 2), (4, -1)}
b.
$$g(x) = \frac{1}{x+5}$$

c. Volume of a sphere: $V = \frac{4}{3}\pi r^3$

d.
$$h(x) = \sqrt{4 - 3x}$$

a. The domain of *f* consists of all first coordinates in the set of ordered pairs.

Domain =
$$\{-3, -1, 0, 2, 4\}$$

b. Excluding *x*-values that yield zero in the denominator, the domain of *g* is the set of all real numbers *x* except x = -5.

c. Because this function represents the volume of a sphere, the values of the radius *r* must be positive.

So, the domain is the set of all real numbers r such that r > 0.

d. This function is defined only for *x*-values for which

$$4-3x\geq 0.$$

By solving this inequality, you can conclude that $x \le \frac{4}{3}$.

So, the domain is the interval $\left(-\infty, \frac{4}{3}\right]$.

In Example 7(c), note that the domain of a function may be implied by the physical context. For instance, from the equation

$$V = \frac{4}{3}\pi r^3$$

you would have no reason to restrict *r* to positive values, but the physical context implies that a sphere cannot have a negative or zero radius.

Applications

You work in the marketing department of a soft-drink company and are experimenting with a new can for iced tea that is slightly narrower and taller than a standard can. For your experimental can, the ratio of the height to the radius is 4.

a. Write the volume of the can as a function of the radius *r*.

b. Write the volume of the can as a function of the height *h*.

a.
$$V(r) = \pi r^2 h$$
 Write V as a function of r.

$$=\pi r^2(4r)$$

$$=4\pi r^3$$

b. $V(h) = \pi r^2 h$ Write V as a function of *h*.

$$= \pi \left(\frac{h}{4}\right)^{2} h$$
$$= \frac{\pi h^{3}}{16}$$
Difference Quotients

One of the basic definitions in calculus employs the ratio $\frac{f(x + h) - f(x)}{h}, \quad h \neq 0.$

This ratio is called a **difference quotient**, as illustrated in Example 11.

.

For
$$f(x) = x^2 - 4x + 7$$
, find $\frac{f(x+h) - f(x)}{h}$

Solution:

$$\frac{f(x+h) - f(x)}{h} = \frac{\left[(x+h)^2 - 4(x+h) + 7\right] - (x^2 - 4x + 7)}{h}$$
$$= \frac{x^2 + 2xh + h^2 - 4x - 4h + 7 - x^2 + 4x - 7}{h}$$
$$= \frac{2xh + h^2 - 4h}{h}$$
$$= \frac{h(2x+h-4)}{h}$$

$$= 2x + h - 4, \quad h \neq 0$$

Summary of Function Terminology

Function: A **function** is a relationship between two variables such that to each value of the independent variable there corresponds exactly one value of the dependent variable.

Function Notation: y = f(x)

f is the name of the function.

y is the dependent variable.

x is the independent variable.

f(x) is the value of the function at x.

Domain: The **domain** of a function is the set of all values (inputs) of the independent variable for which the function is defined. If x is in the domain of f, then f is said to be *defined* at x. If x is not in the domain of f, then f is said to be *undefined* at x.

Range: The **range** of a function is the set of all values (outputs) assumed by the dependent variable (that is, the set of all function values).

Implied Domain: If *f* is defined by an algebraic expression and the domain is not specified, then the **implied domain** consists of all real numbers for which the expression is defined.

The Graph of a Function

We have studied functions from an algebraic point of view. In this section, you will study functions from a graphical perspective.

The graph of a function f is the collection of ordered pairs (x, f(x)) such that x is in the domain of f.

As you study this section, remember that x = the directed distance from the *y*-axis y = f(x) = the directed distance from the *x*-axis as shown below.

Use the graph of the function f, shown in Figure 2.13, to find

- (a) the domain of *f*,
- (b) the function values f(-1) and f(2), and
- (c) the range of *f*.

Figure 2.13

a. The closed dot at (-1, 1) indicates that x = -1 is in the domain of *f*, whereas the open dot at (5, 2) indicates that x = 5 is not in the domain.

So, the domain of f is all x in the interval [-1, 5).

b. Because (-1, 1) is a point on the graph of *f*, it follows that f(-1) = 1. Similarly, because (2, -3) is a point on the graph of *f*, it follows that f(2) = -3.

c. Because the graph does not extend below f(2) = -3 or above f(0) = 3, the range of *f* is the interval [-3, 3].

The Graph of a Function

The use of dots (open or closed) at the extreme left and right points of a graph indicates that the graph does not extend beyond these points.

Figure 2.13

The Graph of a Function

If such dots are not on the graph, then assume that the graph extends beyond these points. By the definition of a function, at most one *y*-value corresponds to a given *x*-value.

This means that the graph of a function cannot have two or more different points with the same *x*-coordinate, and no two points on the graph of a function can be vertically above or below each other.
The Graph of a Function

It follows, then, that a vertical line can intersect the graph of a function at most once.

This observation provides a convenient visual test called the **Vertical Line Test** for functions.

Vertical Line Test for Functions

A set of points in a coordinate plane is the graph of *y* as a function of *x* if and only if no *vertical* line intersects the graph at more than one point.

Zeros of a Function

If the graph of a function of *x* has an *x*-intercept at (*a*, 0), then *a* is a **zero** of the function.

Zeros of a Function

The zeros of a function f of x are the x-values for which f(x) = 0.

Find the zeros of each function.

$$\sqrt{10 - x^2}$$

a. $f(x) = 3x^2 + x - 10$ **b.** $g(x) =$ **c.** $h(t) = \frac{2t - 3}{t + 5}$

Solution:

To find the zeros of a function, set the function equal to zero and solve for the independent variable.

a.
$$3x^{2} + x - 10 = 0 (3x - 5)(x + 2) = 0$$

 $3x - 5 = 0 \implies x = \frac{5}{3}x + 2 = 0 \implies x = -2$

Set f(x) equal to 0.

Factor.

Set 1st factor equal to 0.

Set 2nd factor equal to 0.

Figure 2.14

Example 3 – Solution

b.
$$\sqrt{10 - x^2} = 0$$
$$10 - x^2 = 0$$
$$10 = x^2$$
$$\pm \sqrt{10} = x$$

The zeros of *g* are $x = -\sqrt{10}$ and $\sqrt{10}$. In Figure 2.15, note that the graph of *g* has $(-\sqrt{10}, 0)\sqrt{10}$ J (, 0) as its *x*-intercepts.

Set g(x) equal to 0.

Square each side.

Add x^2 to each side.

Extract square roots.

Zeros of g: $x = \pm$

$$2t - 3 = 0 \ 2t = 3 \ t = \frac{3}{2}$$

Set h(t) equal to 0.

Multiply

each side

by *t* + 5

Add 3 to

each side.

Divide each side by 2.

The zero of *h* is $t = \frac{3}{2}$. In Figure 2.16, note that the graph of $h\frac{3}{2}$ as (, 0) as its *t*-intercept.

The more you know about the graph of a function, the more you know about the function itself. Consider the graph shown in Figure 2.17.

As you move from *left to right*, this

graph falls from x = -2 to x = 0, is constant from x = 0 to x = 2, and rises from x = 2 to x = 4.

Figure 2.17

Increasing, Decreasing, and Constant Functions

A function f is **increasing** on an interval when, for any x_1 and x_2 in the interval,

 $x_1 < x_2$ implies $f(x_1) < f(x_2)$.

A function *f* is **decreasing** on an interval when, for any x_1 and x_2 in the interval,

 $x_1 < x_2$ implies $f(x_1) > f(x_2)$.

A function f is **constant** on an interval when, for any x_1 and x_2 in the interval,

 $f(x_1) = f(x_2).$

Use the graphs to describe the increasing, decreasing, or constant behavior of each function.

- a. This function is increasing over the entire real line.
- **b.** This function is increasing on the interval $(-\infty, -1)$, decreasing on the interval (-1, 1) and increasing on the interval $(1, \infty)$.

c. This function is increasing on the interval $(-\infty, 0)$, constant of the interval (0, 2), and decreasing on the interval (2,).

To help you decide whether a function is increasing, decreasing, or constant on an interval, you can evaluate the function for several values of *x*.

However, you need calculus to determine, for certain, all intervals on which a function is increasing, decreasing, or constant.

The points at which a function changes its increasing, decreasing, or constant behavior are helpful in determining the **relative minimum** or **relative maximum** values of the function.

Definitions of Relative Minimum and Relative Maximum

A function value f(a) is called a **relative minimum** of f when there exists an interval (x_1, x_2) that contains a such that

 $x_1 < x < x_2$ implies $f(a) \le f(x)$.

A function value f(a) is called a **relative maximum** of f when there exists an interval (x_1, x_2) that contains a such that

 $x_1 < x < x_2$ implies $f(a) \ge f(x)$.

Figure 2.18 shows several different examples of relative minima and relative maxima.

We will study a technique for finding the *exact point* at which a second-degree polynomial function has a relative minimum or relative maximum.

For the time being, however, you can use a graphing utility to find reasonable approximations of these points.

Average Rate of Change

We have learned that the slope of a line can be interpreted as a *rate of change*.

For a nonlinear graph whose slope changes at each point, the **average rate of change** between any two points

 $(x_1, f(x_1))$ and $(x_2, f(x_2))$ is the slope of the line through the two points (see Figure 2.20).

Figure 2.20

The line through the two points is called

the **secant line**, and the slope of this line is denoted as m_{sec} . Average rate of

$$\frac{f(x_2) - f(x_1)}{x_2 - x_1}$$

$$\frac{\text{change in } y}{\text{change in } x}$$

change of *f* from x_1 to $x_2 =$

 $= m_{sec}$

Find the average rates of change of $f(x) = x^3 - 3x$ (a) from $x_1 = -2$ to $x_2 = -1$ and (b) from $x_1 = 0$ to $x_2 = 1$ (see Figure 2.21).

Figure 2.21

The average rate of change of *f* from $x_1 = -2$ to $x_2 = -1$ is

$$\frac{f(x_2) - f(x_1)}{x_2 - x_1} = \frac{f(-1) - f(-2)}{-1 - (-2)}$$
$$= \frac{2 - (-2)}{1}$$
$$= 4.$$

Secant line has positive slope.

The average rate of change of *f* from
$$x_1 = 0$$
 to $x_2 = 1$ is

$$\frac{f(x_2) - f(x_1)}{x_2 - x_1} = \frac{f(1) - f(0)}{1 - 0}$$

We have studied different types of symmetry of a graph. In the terminology of functions, a function is said to be **even** when its graph is symmetric with respect to the *y*-axis and **odd** when its graph is symmetric with respect to the origin.

The symmetry tests yield the following tests for even and odd functions.

Tests for Even and Odd Functions

A function y = f(x) is even when, for each x in the domain of f, f(-x) = f(x).

A function y = f(x) is odd when, for each x in the domain of f, f(-x) = -f(x).

Example 8 – Even and Odd Functions

(a) The function $g(x) = x^3 - x$ is odd because g(-x) = -g(x), as follows. = -

$$g(-\mathbf{x}) = (-\mathbf{x})^3 - (-\mathbf{x})$$

g(x)Substitute –x for x.

 $= -x^{3} + x$

 $= -(X^3 - X)$

Functions

Distributive Property Test

$$h(-x) = (-x)^2 + 1$$

= $x^2 + 1$

The function $h(x) = x^2 + 1$ is even because), for odd function 1

as follows. = h(x)

Substitute -x for x.

Test for even function

Simplify.

Figure 2.22 shows the graphs and symmetry of these two functions.

(a) Symmetric to origin: Odd Function

Identify and graph linear and squaring functions.

- Identify and graph cubic, square root, and reciprocal function.
- Identify and graph step and other piecewisedefined functions.
- Recognize graphs of parent functions.

Linear and Squaring Functions

One of the goals of this text is to enable you to recognize the basic shapes of the graphs of different types of functions.

For instance, you know that the graph of the **linear function** f(x) = ax + b is a line with slope m = a and *y*-intercept at (0, *b*).

The graph of the linear function has the following characteristics.

- The domain of the function is the set of all real numbers.
- When m ≠ 0, the range of the function is the set of all real numbers.
- The graph has an x-intercept of (-b/m, 0) and a y-intercept of (0, b).
• The graph is increasing when m > 0, decreasing when m < 0, and constant when m = 0.

Write the linear function *f* for which f(1) = 3 and f(4) = 0.

Solution:

To find the equation of the line that passes through $(x_1, y_1) = (1, 3)$ and $(x_2, y_2) = (4, 0)$ first find the slope of the line.

$$m = \frac{y_2 - y_1}{x_2 - x_1} = \frac{0 - 3}{4 - 1}$$
$$= \frac{-3}{3}$$
$$= -1$$

Next, use the point-slope form of the equation of a line. $y - y_1 = m(x - x_1) y - 3$

$$= -1(x-1) y = -x + 4$$

$$f(x) = -x + 4$$

Point-slope form

Simplify

Function notation

Substitute for x_1 , y_1 and m

The figure below shows the graph of this function.

There are two special types of linear functions, the **constant function** and the **identity function**.

A constant function has the form

$$f(x)=c$$

and has the domain of all real numbers with a range consisting of a single real number *c*.

The graph of a constant function is a horizontal line, as shown in Figure 2.23. The identity function has the form f(x) = x.

Figure 2.23

Its domain and range are the set of all real numbers. The identity function has a slope of m = 1 and a *y*-intercept at (0, 0).

The graph of the identity function is a line for which each *x*-coordinate equals the corresponding *y*-coordinate. The graph is always increasing, as shown in Figure 2.24.

The graph of the **squaring function** $f(x) = x^2$

is a U-shaped curve with the following characteristics.

• The domain of the function is the set of all real numbers.

- The range of the function is the set of all nonnegativereal numbers.
- The function is even.
- The graph has an intercept at (0, 0).
- The graph is decreasing on the interval $(-\infty, 0)$ and increasing on the interval $(0, \infty)$
- The graph is symmetric with respect to the *y*-axis.
- The graph has a relative minimum at (0, 0).

The figure below shows the graph of the squaring function.

Cubic, Square Root, and Reciprocal Functions

The following summarizes the basic characteristics of the graphs of the **cubic**, **square root**, and **reciprocal functions**.

- **1.** The graph of the *cubic* function $f(x) = x^3$ has the following characteristics.
 - •The domain of the function is the set of all real numbers.

•The range of the function is the set of all real numbers.

•The function is odd.

- •The graph has an intercept at (0, 0).
- •The graph is increasing on the interval ($-\infty$ \Rightarrow
- •The graph is symmetric with respect to the origin.

The figure shows the graph of the cubic function.

Cubic function

- **2.** The graph of the square root function $f(x) = \sqrt{x}$ has the following characteristics.
 - •The domain of the function is the set of all nonnegative real numbers.

•The range of the function is the set of all nonnegativereal numbers.

•The graph has an intercept at (0, 0).

•The graph is increasing on the interval (0, ∞) The figure shows the graph of the square root function.

Square root function

3. The graph of the *reciprocal* function $f(x) = \overline{x}$ has the following characteristics.

•The domain of the function is $(-\infty, 0) \cup (0, \infty)$

- •The range of the function is $(-\infty 0) \cup (0, \infty)$
- •The function is odd.
- •The graph does not have any intercepts.
- •The graph is decreasing on the intervals (, 0) and $(-\infty)$.

•The graph is symmetric with respect to the origin. The figure shows the graph of the reciprocal function.

Reciprocal function

Step and Piecewise-Defined Functions

Functions whose graphs resemble sets of stairsteps are known as **step functions**.

The most famous of the step functions is the **greatest** integer function, which is denoted by and def x as

f(x) = [x] = the greatest integer less than or equal to x.

Some values of the greatest integer function are as follows.

$$\llbracket -1 \rrbracket = (greatest integer \le -1) = -1$$

$$\begin{bmatrix} -\frac{1}{2} \end{bmatrix} = (\text{greatest integer } \leq -\frac{1}{2}) = -1$$
$$\begin{bmatrix} \frac{1}{10} \end{bmatrix} = (\text{greatest integer } \leq \frac{1}{10}) = 0$$
$$\begin{bmatrix} 1.5 \end{bmatrix} = (\text{greatest integer } \leq 1.5) = 1 \quad \begin{bmatrix} 1.9 \end{bmatrix} = 0$$

(greatest integer \leq 1.9) = 1 The graph of

the greatest integer function

$$f(\mathbf{x}) = \llbracket x \rrbracket$$

has the following characteristics, as shown in Figure 2.25.

• The domain of the function is the set of all real numbers.

- The range of the function is the set of all integers.
- The graph has a *y*-intercept at (0, 0) and *x*-intercepts in the interval [0, 1).

- The graph is constant between each pair of consecutive integers values of *x*.
- The graph jumps vertically one unit at each integervalue of *x*.

Evaluate the function when x = -1, 2 and $\frac{3}{2}$, f(x) = -4[x]

Solution:

For x = -1, the greatest integer ≤ -1 is -1, so f(-

$$1) = \begin{bmatrix} -1 \\ -1 \end{bmatrix} _{1}$$
$$= -1 + 1$$
$$= 0$$

For
$$x = 2$$
, the greatest integer ≤ 2 is 2,
so $f(2)^{[2]} + 1 = 2 + 1 = 3$.
For $x = \frac{3}{2}$, the greatest integer $\le \frac{3}{2}$ is 1, so $f(\frac{3}{2}) = [\frac{3}{2}] + 1$
 $= 1 + 1$
 $= 2$

Verify your answers by examining the graph f(x) = [x] + 1 shown in Figure 2.26.

Figure 2.26

Parent Functions

The eight graphs shown below represent the most commonly used functions in algebra.

Familiarity with the basic characteristics of these simple graphs will help you analyze the shapes of more complicated

graphs—in particular, graphs obtained from these graphs by the rigid and non-rigid transformations.

Functions and Their Graphs

Copyright © Cengage Learning. All rights reserved.

Copyright © Cengage Learning. All rights reserved.

Use vertical and horizontal shifts to sketch graphs of functions.

Use reflections to sketch graphs of functions.

Use nonrigid transformations to sketch graphs of functions.

Many functions have graphs that are simple transformations of the parent graphs.

For example, you can obtain the graph of

$$h(x) = x^2 + 2$$

by shifting the graph of $f(x) = x^2 up$ two units, as shown in Figure 2.28.

Figure 2.28

In function notation, *h* and *f* are related as follows.

 $h(x) = x^2 + 2 = f(x) + 2$ Upward shift of two units

Similarly, you can obtain the graph of

$$g(x) = (x-2)^2$$

by shifting the graph of $f(x) = x^2$ to the *right* two units, as shown in Figure 2.29.

Figure 2.29

In this case, the functions *g* and *f* have the following relationship.

$$g(x) = (x-2)^2 = f(x-2)$$
 Right shift of two units

The following list summarizes this discussion about horizontal and vertical shifts.

Vertical and Horizontal Shifts

Let *c* be a positive real number. Vertical and horizontal shifts in the graph of y = f(x) are represented as follows.

- **1.** Vertical shift *c* units *up*: h(x) = f(x) + c
- **2.** Vertical shift *c* units *down*: h(x) = f(x) c
- **3.** Horizontal shift *c* units to the *right*: h(x) = f(x c)
- **4.** Horizontal shift *c* units to the *left:* h(x) = f(x + c)
Shifting Graphs

Some graphs can be obtained from combinations of vertical and horizontal shifts, as demonstrated in Example 1(b).

Shifting Graphs

Vertical and horizontal shifts generate a *family of functions*, each with the same shape but at a different location in the plane.

Use the graph of $f(x) = x^3$ to sketch the graph of each function. **a.** $g(x) = x^3 - 1$ **b.** $h(x) = (x + 2)^3$ + 1

Solution:

a. Relative to the graph of $f(x) = x^3$,

the graph of $g(x) = x^3 - 1$

is a downward shift of one unit, as shown in the figure at the

1

right.

b. Relative to the graph of $f(x) = x^3$, the graph of $h(x) = (x + 2)^3 + 1$

involves a left shift of two units and an upward shift of one unit, as shown in figure below.

In Example 1(b), you obtain the same result when the vertical shift precedes the horizontal shift *or* when the horizontal shift precedes the vertical shift.

Reflecting Graphs

Another common type of transformation is a **reflection.**

For instance, if you consider the *x*axis to be a mirror, the graph of $h(x) = -x^2$

is the mirror image (or reflection) of the graph of $f(x) = x^2$, as shown in Figure 2.30.

Figure 2.30

Reflections in the Coordinate Axes

Reflections in the coordinate axes of the graph of y = f(x) are represented as follows.

- **1.** Reflection in the *x*-axis: h(x) = -f(x)
- **2.** Reflection in the *y*-axis: h(x) = f(-x)

The graph of the function

$$f(x) = x^4$$

is shown in Figure 2.31.

Figure 2.31

Each of the graphs below is a transformation of the graph of *f*. Write an equation for each of these functions.

a. The graph of g is a reflection in the x-axis followed by an upward shift of two units of the graph of $f(x) = x^4$.

So, the equation for *g* is
$$g(x) = -x^4 + 2$$
.

b. The graph of *h* is a horizontal shift of three units to the right followed by a reflection in the *x*-axis of the graph of $f(x) = x^4$.

So, the equation for *h* is $h(x) = -(x - 3)^4$.

When sketching the graphs of functions involving square roots, remember that you must restrict the domain to exclude negative numbers inside the radical.

For instance, here are the domains of the functions:

Domain of
$$g(x) = -\sqrt{x}$$
: $x \ge 0$
Domain of $h(x) = \sqrt{-x}$: $x \le 0$
Domain of $k(x) = -\sqrt{x+2}$: $x \ge -2$

Nonrigid Transformations

Horizontal shifts, vertical shifts, and reflections are **rigid transformations** because the basic shape of the graph is unchanged.

These transformations change only the *position* of the graph in the coordinate plane.

Nonrigid transformations are those that cause a distortion—

a change in the shape of the original graph.

For instance, a nonrigid transformation of the graph of y = f(x) is represented by g(x) = cf(x), where the transformation is a **vertical stretch** when c > 1 and a **vertical shrink** if 0 < c < 1.

Another nonrigid transformation of the graph of y = f(x) is represented by h(x) = f(cx), where the transformation is a **horizontal shrink** when c > 1 and a **horizontal stretch** when 0 < c < 1.

Compare the graph of each function with the graph of f(x) = |x|.

a.
$$h(x) = 3|x|$$
 b. $g(x) = \frac{1}{3}|x|$

Solution:

a. Relative to the graph of f(x) = |x|, the graph of h(x) = 3|x| = 3f(x) is a vertical stretch (each *y*-value is multiplied by 3) of the graph of *f*.

Figure 2.32

b. Similarly, the graph of

$$g(x) = \frac{1}{3}|x| = \frac{1}{3}(x)$$

is a vertical shrink (each *y*-value is multiplied by $\frac{1}{3}$) of the graph of *f*. (See Figure 2.33.)

Add, subtract, multiply, and divide functions.

Find the composition of one function with another function.

Use combinations and compositions of functions to model and solve real-life problems.

Arithmetic Combinations of Functions

Just as two real numbers can be combined by the operations of addition, subtraction, multiplication, and division to form other real numbers, two *functions* can be combined to create new functions.

For example, the functions given by f(x) = 2x - 3 and $g(x) = x^2 - 1$ can be combined to form the sum, difference, product, and quotient of *f* and *g*.

$$f(x) + g(x) = (2x - 3) + (x^2 - 1)$$

Arithmetic Combinations of Functions

$$= x^{2} + 2x - 4$$
 Sum
$$f(x) - g(x) = (2x - 3) - (x^{2} - 1)$$

 $= -x^2 + 2x - 2$ Difference

$$f(x)g(x) = (2x-3)(x^2-1)$$

$$= 2x^3 - 3x^2 - 2x + 3$$
 Product

$$\frac{f(x)}{g(x)} = \frac{2x-3}{x^2-1}, \quad x \neq \pm 1$$
Quotient

5 5

Arithmetic Combinations of Functions

The domain of an **arithmetic combination** of functions *f* and *g* consists of all real numbers that are common to the domains of *f* and *g*.

In the case of the quotient f(x)/g(x), there is the further restriction that $g(x) \neq 0$.

Sum, Difference, Product, and Quotient of Functions

Let f and g be two functions with overlapping domains. Then, for all x common to both domains, the *sum*, *difference*, *product*, and *quotient* of f and g are defined as follows.

- 1. Sum: (f + g)(x) = f(x) + g(x)
- **2.** Difference: (f g)(x) = f(x) g(x)
- **3.** Product: $(fg)(x) = f(x) \cdot g(x)$

4. Quotient:
$$\left(\frac{f}{g}\right)(x) = \frac{f(x)}{g(x)}, \quad g(x) \neq 0$$

Given f(x) = 2x + 1 and $g(x) = x^2 + 2x - 1$, find (f + g)(x). Then evaluate the sum when x = 3.

Solution:

The sum of *f* and *g* is

$$(f+g)(x) = f(x) + g(x) = (2x+1) + (x^2 + 2x - 1)$$

$$= x^{2} + 4x$$

When x = 3, the value of this sum is

$(f+g)(3) = 3^2 + 4(3) = 21.$ Composition of Functions

Another way of combining two functions is to form the **composition** of one with the other.

For instance, if $f(x) = x^2$ and g(x) = x + 1, the composition of

f with g is f(g(x)) = f(x + 1)

$$= (x + 1)^2$$
.

This composition is denoted as $f^{\circ}g$ and reads as *"f* composed with *g*."

Definition of Composition of Two Functions

The **composition** of the function f with the function g is

 $(f \circ g)(x) = f(g(x)).$

The domain of $f \circ g$ is the set of all x in the domain of g such that g(x) is in the domain of f. (See Figure 2.36.)

Figure 2.36

Given f(x) = x + 2 and $g(x) = 4 - x^2$, find the following. **a.** $(f \circ g)(x)$ **b.** $(g \circ f)(x)$ **c.** $(g \circ f)(-2)$

Solution:

- **a.** The composition of *f* with *g* is as follows.
 - $(f \circ g)(x) = f(g(x)) = -x^{2} + 6$ $= f(4 - x^{2})$ $= (4 - x^{2}) + 2$ Definition of g(x)

Definition of f(x) Simplify.

b. The composition of *g* with *f* is as follows.

 $(g \circ f)(x) = g(f(x))$ Definition of $g \circ f$ = g(x + 2)Definition of f(x) $= 4 - (x + 2)^2$ Definition of g(x) $= 4 - (x^2 + 4x + 4)$ Expand.

$$= -x^2 - 4x$$
 Simplify.

Note that, in this case, $(f \circ g)(x) \neq (g \circ f)(x)$.

c. Using the result of part (b), write the following.

$$(g \circ f)(-2) = -(-2)_2 - 4(-2)$$
 Substitute.
= -4 + 8 Simplify.
= 4 Simplify.

In Example 5, you formed the composition of two given functions.

In calculus, it is also important to be able to identify two functions that make up a given composite function.

For instance, the function $h(x) = (3x - 5)^3$ is the

composition of $f(x) = x^3$ and g(x) = 3x - 5. That is,

 $h(x) = (3x - 5)^3 = [g(x)]^3 = f(g(x)).$

Basically, to "decompose" a composite function, look for an "inner" function and an "outer" function. In the function *h*, g(x) = 3x - 5 is the inner function and $f(x) = x^3$ is the outer function.

Application

The number *N* of bacteria in a refrigerated food is given by

 $N(T) = 20T^2 - 80T + 500$, $2 \le T \le 14$ where *T* is the temperature of the food in degrees Celsius. When the food is removed from refrigeration, the temperature of the food is given by

T(t) = 4t + 2, $0 \le t \le 3$ where *t* is the

time in hours.
- **a.** Find the composition $(N \circ T)(t)$ and interpret its meaning in context.
- **b.** Find the time when the bacteria count reaches 2000.

$$(N \circ T)(t) = N(T(t)) = 20(4t + 2)^2 - 80(4t + 2) + 500$$

 $= 20(16t^{2} + 16t + 4) - 320t - 160 + 500$

 $= 320t^{2} + 320t + 80 - 320t - 160 + 500$

$$= 320t^{2} + 420$$

The composite function $(N \circ T)(t)$ represents the number of bacteria in the food as a function of the amount of time the food has been out of refrigeration.

The bacteria count will reach 2000 when $320t^2 + 420 = 2000$. Solve this equation to find that the count will reach 2000 when $t \approx 2.2$ hours.

Note that when you solve this equation, you reject the negative value because it is not in the domain of the composite function.

Functions and Their Graphs

Copyright © Cengage Learning. All rights reserved.

Copyright © Cengage Learning. All rights reserved.

- Find inverse functions informally and verify that two functions are inverse functions of each other.
- Use graphs of functions to determine whether functions have inverse functions.
- Use the Horizontal Line Test to determine if functions are one-to-one.

Find inverse functions algebraically.

Inverse Functions

We know that a set of ordered pairs can represent a function.

For instance, the function f(x) = x + 4 from the set $A = \{1, 2, 3, 4\}$ to the set $B = \{5, 6, 7, 8\}$ can be written as follows.

 $f(x) = x + 4: \{(1, 5), (2, 6), (3, 7), (4, 8)\}$

Inverse Functions

In this case, by interchanging the first and second coordinates of each of these ordered pairs, you can form the **inverse function** of *f*, which is denoted by f^{-1} . It is a function from the set *B* to the set *A*, and can be written as follows.

 $f^{-1}(x) = x - 4$: {(5, 1), (6, 2), (7, 3), (8, 4)}

Note that the domain of *f* is equal to the range of f^{-1} , and vice versa, as shown in Figure below. Also note that the functions *f* and f^{-1} have the effect of "undoing" each other.

In other words, when you form the composition of f with f^{-1} or the composition of f^{-1} with f, you obtain the identity function.

$$f(f^{-1}(x)) = f(x-4) = (x-4) + 4 = x f$$
$$^{-1}(f(x)) = f^{-1}(x+4) = (x+4) - 4 = x$$

Find the inverse of f(x) = 4x. Then verify that both $f(f^{-1}(x))$ and $f^{-1}(f(x))$ are equal to the identity function.

Solution:

The function *f multiplies* each input by 4. To "undo" this function, you need to *divide* each input by 4.

So, the inverse function of f(x) = 4x is

$$f^{-1}(x) = \frac{x}{4}.$$

Verify that $f(f^{-1}(x)) = x$ and $f^{-1}(f(x)) = x$ as follows.

$$f(f^{-1}(x)) = f\left(\frac{x}{4}\right)$$
$$= 4\left(\frac{x}{4}\right)$$
$$= x$$

$$= x$$

$$f^{-1}(f(x)) = f^{-1}(4x)$$
$$= \frac{4x}{4}$$
$$= x$$

Definition of Inverse Function

Let f and g be two functions such that

f(g(x)) = x for every x in the domain of g

and

g(f(x)) = x for every x in the domain of f.

Under these conditions, the function g is the **inverse function** of the function f. The function g is denoted by f^{-1} (read "f-inverse"). So,

 $f(f^{-1}(x)) = x$ and $f^{-1}(f(x)) = x$.

The domain of f must be equal to the range of f^{-1} , and the range of f must be equal to the domain of f^{-1} .

Do not be confused by the use of -1 to denote the inverse function f^{-1} .

In this section, whenever f^{-1} is written, it *always* refers to the inverse function of the function *f* and *not* to the reciprocal of f(x).

If the function g is the inverse function of the function f, it must also be true that the function f is the inverse function of the function g.

For this reason, you can say that the functions *f* and *g* are *inverse functions of each other*.

The Graph of an Inverse Function

The graphs of a function *f* and its inverse function f^{-1} are related to each other in the following way.

If the point (*a*, *b*) lies on the graph of *f*, then the point (*b*, *a*) must lie on the graph of f^{-1} , and vice versa.

This means that the graph of f^{-1} is a *reflection* of the graph of *f* in the line y = x, as shown in Figure 2.37.

Sketch the graphs of the inverse functions f(x) = 2x - 3and $f^{-1}(x) = \frac{1}{2}(x + 3)$ on the same rectangular coordinate system and show that the graphs are reflections of each other in the line y = x.

The graphs of f and f^{-1} are shown in Figure 2.38.

It appears that the graphs are reflections of each other in the line y = x.

You can further verify this reflective property by testing a few points on each graph.

Note in the following list that if the point (*a*, *b*) is on the graph of *f*, the point (*b*, *a*) is on the graph of f^{-1} .

Graph of
$$f(x) = 2x - 3$$
Graph of $f^{-1}(x) = \frac{1}{2}(x + 3)$ $(-1, -5)$ $(-5, -1)$ $(0, -3)$ $(-3, 0)$ $(1, -1)$ $(-1, 1)$ $(2, 1)$ $(1, 2)$

(3, 3) (3, 3) One-to-One Functions

One-to-One Functions

The reflective property of the graphs of inverse functions gives you a nice *geometric* test for determining whether a function has an inverse function.

This test is called the **Horizontal Line Test** for inverse functions.

If no horizontal line intersects the graph of *f* at more than

Horizontal Line Test for Inverse Functions

A function f has an inverse function if and only if no *horizontal* line intersects the graph of f at more than one point.

One-to-One Functions

A function f is **one-to-one** when each value of the dependent variable corresponds to exactly one value of the independent variable. A function f has an inverse function if and only if f is one-to-one.

One-to-One Functions

one point, then no *y-value* is matched with more than one *x*-value.

This is the essential characteristic of what are called **oneto-one functions.**

Consider the function given by $f(x) = x^2$. The table on the left is a table of values for $f(x) = x^2$. The table on the right is the same as the table on the left but with the values in the columns interchanged.

One-to-One Functions

x	$f(x) = x^2$
-2	4
-1	1
0	0
1	1
2	4
3	9

x	у	
4	-2	
1	-1	
0	0	
1	1	
4	2	
9	3	

The table on the right does not represent a function because the input x = 4 is matched with two different outputs: y = -2 and y = 2. So, $f(x) = x^2$ is not one-to-one and does not have an inverse function. The graph of the function given by $f(x) = x^3 - 1$ is shown in Figure 2.40.

Figure 2.40

Because no horizontal line intersects the graph of *f* at more than one point, you can conclude that *f* is a one-to-one function and *does* have an inverse function.

The graph of the function given by $f(x) = x^2 - 1$ is shown in Figure 2.41.

Figure 2.41

Because it is possible to find a horizontal line that intersects the graph of *f* at more than one point, you can conclude that *f* is not a one-to-one function and *does not* have an inverse function.

Finding Inverse Functions Algebraically

For relatively simple functions (such as the one in Example 1), you can find inverse functions by inspection. For more complicated functions, however, it is best to use the following guidelines.

The key step in these guidelines is Step 3—interchanging the roles of *x* and *y*. This step corresponds to the fact that

inverse functions have ordered pairs with the coordinates reversed.

Finding an Inverse Function

- 1. Use the Horizontal Line Test to decide whether *f* has an inverse function.
- **2.** In the equation for f(x), replace f(x) with y.
- 3. Interchange the roles of x and y, and solve for y.
- 4. Replace y with $f^{-1}(x)$ in the new equation.
- 5. Verify that f and f^{-1} are inverse functions of each other by showing that the domain of f is equal to the range of f^{-1} , the range of f is equal to the domain of f^{-1} , and $f(f^{-1}(x)) = x$ and $f^{-1}(f(x)) = x$.

Find the inverse function of $f(x) = \frac{5 - 3x}{2}$

Solution:

The graph of *f* is shown in Figure 2.42.

This graph passes the Horizontal Line Test. So, you know that is one-to-one and has an inverse function.

$$f(x) = \frac{5 - 3x}{2}$$

$$y = \frac{5-x}{3x+2}$$

$$x = \frac{5 - 3y}{2}$$

Write original function.

Replace f(x) by y.

Interchange x and y.

x(3y+2)=5-y

Multiply each side by 3y + 2.

$$3xy + 2x = 5 - y$$
 Distributive

Property

$$3xy + y = 5 - 2x$$
 Collect terms with y.

y(3x + 1) = 5 - 2x Factor.

$$y = \frac{5 - 2x}{3x + 1}$$

$$f^{-1}(x) = \frac{5 - 2x}{3x + 1}$$
Solve for y.
Replace y by $f^{-1}(x)$.

Check that $f(f^{-1}(x)) = x$ and $f^{-1}(f(x)) = x$.
