**32.** Graph  $y = x^3$ . The graph passes the vertical line

test. Thus, the equation represents a function.

**33.** Graph  $y = \frac{1}{x}$ . The graph passes the vertical line

test. Thus, the equation represents a function.

34. Graph y = |x|. The graph passes the vertical line test. Thus, the equation represents a function.

Solve for 
$$y: y = \pm \sqrt{4 - x^2}$$

**37.**  $x = y^2$ Solve for  $y: y = \pm \sqrt{x}$ 

> For x = 1,  $y = \pm 1$ . Thus, (1, 1) and (1, -1) are on the graph. This is not a function, since a distinct *x*-value corresponds to two different *y*-values.

**38.**  $x + y^2 = 1$ Solve for  $y: y = \pm \frac{\sqrt{1-x}}{1-x}$ 

For x = 0,  $y = \pm 1$ . Thus, (0, 1) and (0, -1) are on the graph. This is not a function, since a distinct *x*-value corresponds to two different *y*-values.

**39.** Graph  $y = x^2$ . The graph passes the vertical line

**40.** Graph  $y = \frac{3x-1}{x+2}$ . The graph passes the vertical

**41.**  $2x^2 + 3y^2 = 1$ 

Solve for y: 
$$2x^{2} + 3y^{2} = 1$$
  
 $3y^{2} = 1 - 2x^{2}$   
 $y^{2} = \frac{1 - 2x^{2}}{3}$   
 $y = \pm \sqrt{\frac{1 - 2x^{2}}{3}}$   
For  $x = 0, y = \pm \sqrt{\frac{1}{3}}$ . Thus,  $\begin{bmatrix} 0, \sqrt{\frac{1}{3}} \\ 0, \end{bmatrix}$  and

For x = 0,  $y = \pm 2$ . Thus, (0, 2) and (0, -2) are on

the graph. This is not a function, since a distinct *x*-

value corresponds to two different y-values.

## **36.** $y = \pm \sqrt{1 - 2x}$

For x = 0,  $y = \pm 1$ . Thus, (0, 1) and (0, -1) are on the graph. This is not a function, since a distinct *x*-value corresponds to two different *y*-values.  $\begin{pmatrix} 0, -\sqrt{1} \\ \sqrt{3} \end{pmatrix}$  are on the graph. This is not a

function, since a distinct *x*-value corresponds to two different *y*-values.

42. 
$$x^2 - 4y^2 = 1$$
  
Solve for y:  $x^2 - 4y^2 = 1$   
 $4y^2 = x^2 - 1$   
 $y^2 = \frac{x^2 - 1}{4}$ 

$$y = \frac{\pm\sqrt{x^2 - 1}}{2}$$

For  $x = \sqrt{2}$ ,  $y = \pm \frac{1}{2}$ . Thus,  $\begin{pmatrix} 2, \frac{1}{2} \\ \sqrt{2} \end{pmatrix}$  and

$$\left(\sqrt{2}, -\frac{1}{2}\right)$$
 are on the graph. This is not a

function, since a distinct *x*-value corresponds to two different *y*-values.

32. 
$$h(x) = -\frac{136x^2}{x^2} + 2.7x + 3.5$$

**a.** We want 
$$h(15) = 10$$
.  
$$-\frac{136(15)}{v^2} + 2.7(15) + 3.5 = 10$$

$$\frac{30,600}{v^2} = -34$$
$$v^2 = 900$$

v = 30 ft/sec The ball needs to be thrown with an initial velocity of 30 feet per second.

$$126x^{2}$$

when it has traveled 9 feet in front of the foul line.

**d.** Select several values for *x* and use these to find the corresponding values for *h*. Use the results to form ordered pairs (x, h). Plot the points and connect with a smooth curve.

 $h(0) = -\frac{34}{225}(0)^2 + 2.7(0) + 3.5 = 3.5 \text{ ft}$  $h(5) = -\frac{34}{225}(5)^2 + 2.7(5) + 3.5 \approx 13.2 \text{ ft}$ 

$$h(15) = -\frac{24}{225}(15)^2 + 2.7(15) + 3.5 \approx 10$$
 ft

Thus, some points on the graph are (0, 3.5),

(5,13.2), and (15,10). The complete graph is given below.

**33.** 
$$h(x) = -\frac{44x^2}{v^2} + x + 6$$

**a.** 
$$h(8) = \frac{=44(8)^2}{2} + (8) + 6$$
  
$$= -\frac{2816}{784} + 14$$

which simplifies to

$$h(x) = -\frac{34}{225}x^2 + 2.7x + 3.5$$

**c.** Using the velocity from part (b),

$$h(9) = -\frac{34}{225}(9)^2 + 2.7(9) + 3.5 = 15.56$$
 ft

The ball will be 15.56 feet above the floor

≈9.9 feet

**c.** From part (a) we know the point (8,10.4) is on the graph and from part (b) we know the point (12,9.9) is on the graph. We could evaluate the function at several more values of *x* (e.g. x = 0, x = 15, and x = 20) to obtain additional points.

$$h(0) = -\frac{44(0)}{28^{2}} + (0) + 6 = 6$$

$$28^{2}$$

$$h(15) = -\frac{44(15)^{2}}{28^{2}} + (15) + 6 \approx 8.4$$

$$28^{2}$$

$$h(20) = -\frac{44(20)^{2}}{28^{2}} + (20) + 6 \approx 3.6$$

$$28^{2}$$

Some additional points are (0,6), (15,8.4)and (20,3.6). The complete graph is given

below.

**d.** 
$$h(15) = -\frac{44(15)}{28^2} + (15) + 6 \approx 8.4$$
 feet

No; when the ball is 15 feet in front of the foul line, it will be below the hoop. Therefore it cannot go through the hoop.

In order for the ball to pass through the hoop, we need to have h(15) = 10.

$$10 = -\frac{44(15)}{v^{2}} + (15) + 6$$
$$-11 = -\frac{44(15)^{2}}{v^{2}}$$
$$v^{2} = 4(225)$$

have at most one *x*-intercept on the interval. The graph of f could not "turn" and cross it again or it would start to decrease.

**98.** An increasing function is a function whose graph goes up as you read from left to right.

A decreasing function is a function whose graph goes down as you read from left to right.

even and odd, we would need f(x) = -f(x).

This is only possible if f(x) = 0.

**71.** The graphs of  $y = x^n$ , *n* a positive odd integer,

all have the same general shape. All go through the points (-1, -1), (0, 0), and (1, 1). As *n* increases, the graph of the function increases at a greater rate for x > 1 and is flatter around 0 for |x| < 1.

Yes, it is a function.  
Domain =  $\{x \mid x \text{ is any real number}\}$  or  $(-\infty, \infty)$   
Range =  $\{0, 1\}$  or  $\{y \mid y = 0 \text{ or } y = 1\}$   
y-intercept:  $x = 0 \Rightarrow x$  is rational  $\Rightarrow y = 1$ 

So the *y*-intercept is y = 1.

*x*-intercept:  $y = 0 \Longrightarrow x$  is irrational

So the graph has infinitely many *x*-intercepts,

namely, there is an *x*-intercept at each irrational value of *x*.

f(-x) = 1 = f(x) when x is rational; f(-x) = 0 = f(x) when x is irrational. Thus, f is even.

The graph of f consists of 2 infinite clusters of distinct points, extending horizontally in both directions. One cluster is located 1 unit above the *x*-axis, and the other is located along the *x*-axis.

**73.** For 0 < x < 1, the graph of  $y = x^r$ , *r* rational and

**2.**  $f(x) = \sqrt{4-5x}$ 

The function tells us to take the square root of 4-5x. Only nonnegative numbers have real square roots so we need  $4-5x \ge 0$ .

 $4-5x \ge 0$  $4-5x-4 \ge 0-4$  $-5x \ge -4$ 

 $3. \quad g(x) = \frac{x+2}{|x+2|}$

$$4. \quad h(x) = \frac{x-4}{x^2 + 5x - 36}$$

The function tells us to divide x - 4 by

 $x^{2} + 5x - 36$ . Since division by 0 is not defined, we need to exclude any values which make the denominator 0.

$$x^{2} + 5x - 36 = 0$$
  
(x+9)(x-4) = 0  
x = -9 or x = 4  
Domain: {x | x \neq -9, x \neq 4}

x = 1. According to the graph, f(1) = 3.

**d.** Since (-5, -3) and (3, -3) are the only

points on the graph for which y = f(x) = -3, we have f(x) = -3 when x = -5 and x = 3. e. To solve f(x) < 0, we want to find x-

values such that the graph is below the x-axis. The graph is below the x-axis for values in the domain that are less than -2 and greater than 2. Therefore, the solution set is  $\{x \mid -5 \le x < -2 \text{ or } 2 < x \le 5\}$ . In interval notation we would write the solution set as  $[-5, -2) \cup (2, 5]$ .

6.  $f(x) = -x^4 + 2x^3 + 4x^2 - 2$ We set Xmin = -5 and Xmax = 5. The standard

Ymin and Ymax will not be good enough to see the

We see that the graph has a local maximum of -0.86 (rounded to two places) when x = -0.85 and another local maximum of 15.55 when

x = 2.35. There is a local minimum of -2 when x = 0. Thus, we have

Local maxima:  $f(-0.85) \approx -0.86$  $f(2.35) \approx 15.55$ 

Local minima: f(0) = -2

The function is increasing on the intervals [-5, -0.85] and [0, 2.35] and decreasing on the

keep the part for which  $x \ge -1$ .

**b.** To find the intercepts, notice that the only piece that hits either axis is y = x - 4.

y = x - 4	y = x - 4
y = 0 - 4	0 = x - 4
y = -4	4 = x

The intercepts are (0, -4) and (4, 0).

10. a. The basic function is  $y = x^3$  so we start with the graph of this function.

Next we shift this graph 1 unit to the left to

obtain the graph of  $y = (x+1)^3$ .

Next we reflect this graph about the x-axis

Next we stretch this graph vertically by a factor of 2 to obtain the graph of  $y = -2(x+1)^3$ .

**b.** The basic function is y = |x| so we start

with the graph of this function.

Next we shift this graph 4 units to the left to  $\begin{vmatrix} & \\ & \\ & \end{vmatrix}$ obtain the graph of y = x + 4.

Next we shift this graph up 2 units to obtain the graph of  $y = x + 4 \neq 2$ .

- **11.** a.  $r(x) = -0.115x^2 + 1.183x + 5.623$ 
  - For the years 1992 to 2004, we have values of *x* between 0 and 12. Therefore, we can let Xmin = 0 and Xmax = 12. Since *r* is the

interest rate as a percent, we can try letting Ymin = 0 and Ymax = 10.

×Ύs=	Yscl=1
\Y6=	Xres=1

The highest rate during this period appears to be 8.67%, occurring in 1997 (  $x \approx 5$  ).

**b.** For 2010, we have x = 2010 - 1992 = 18.

$$r(18) = -0.115(18)^{2} + 1.183(18) + 5.623$$
$$= -10.343$$

The model predicts that the interest rate will be -10.343%. This is not a reasonable value since it implies that the bank would be paying interest to the borrower.

**12. a.** Let x = width of the rink in feet. Then the

length of the rectangular portion is given by 2x - 20. The radius of the semicircular

portions is half the width, or  $r = \frac{x}{2}$ .

To find the volume, we first find the area of the surface and multiply by the thickness of

the ice. The two semicircles can be combined to form a complete circle, so the area is given by

$$A = l \cdot w + \pi r^{2}$$
$$= (2x - 20)(x) + \pi \left(\frac{x}{2}\right)^{2}$$

$$0.75 \text{ in} \cdot \frac{1 \text{ ft}}{12 \text{ in}} = \frac{0.75}{12} \text{ ft} = \frac{1}{16} \text{ ft}$$

Now we multiply this by the area to obtain the volume. That is,

$$V(x) = \frac{1}{16} \left( 2x^2 - 20x + \frac{\pi x^2}{4} \right)$$

$$V(x) = \frac{2x}{8} - \frac{5x}{4} + \frac{\pi^2}{64}$$

**b.** If the rink is 90 feet wide, then we have x = 90.

$$V(90) = \frac{90^2}{8} - \frac{5(90)}{4} + \frac{\pi(90)^2}{64} \approx 1297.61$$

The volume of ice is roughly 1297.61  $\text{ft}^3$ .

the past decade the availability and usage Internet services have increased. The industry has developed a number of pricing proposals for such services. Marketing data have indicated that subscribers of wireless Internet services have tended to desire flat fee rate structures as compared with rates based totally on usage. The Computer Resource Department of Indigo Media (hypothetical) has entered into a contractual agreement for wireless Internet services. As a part of the contractual agreement, employees are able to sign up for their own wireless services. Three pricing options are available:

Silver Plan:	\$20/month for up to 200 K-bytes of
	service plus \$0.16 for each addi-
	tional K-byte of service
Gold Plan:	\$50/month for up to 1000 K-bytes of service plus \$0.08 for each addi- tional K-byte of service
	2

#### Platinum Plan: \$100/month for up to 3000 K-bytes of service plus \$0.04 for each additional K-byte of service

You have been requested to write a report that answers the following questions in order to aid employees in choosing the appropriate pricing plan.

- (a) If C is the monthly charge for x K-bytes of service, express C as a function of x for each of the three plans.
- (b) Graph each of the three functions found in part (a).
- (c) For how many K-bytes of service is the Silver Plan the best pricing option? When is the Gold Plan best? When is the Platinum Plan best? Explain your reasoning.
- (d) Write a report that summarizes your findings.

**3.** Cost of Cable You work for the Silver Satellite & Cable TV Company in the Research & Development Department. You have been asked to come up with a formula to determine the cost of running cable from a connection box to a new cable household. The first example that you are working with involves the Steven family, who own a rural home with a driveway 2 miles long extending to the house from a nearby highway. The nearest connection box is along the highway but 5 miles from the driveway.

It costs the company \$100 per mile to install cable along the highway and \$140 per mile to install cable off the highway. Because the Steven's house is surrounded by farmland that they own, it would be possible to run the cable overland to the house directly from the connection box or from any point between the connection box to the driveway.

- (a) Draw a sketch of this problem situation, assuming that the highway is a straight road and the driveway is also a straight road perpendicular to the highway. Include two or more possible routes for the cable.
- (b) Let x represent the distance in miles that the cable runs along the highway from the connection box before turning off toward the house. Express the total cost of installation as a function of x. (You may choose to answer part (c) before part (b) if you would like to examine concrete instances before creating the equation.)
- (c) Make a table of the possible integral values of x and the corresponding cost in each instance. Does one choice appear to cost the least?
- (d) If you charge the Stevens \$800 for installation, would you be willing to let them choose which way the cable would go? Explain.
- (e) Using a graphing calculator, graph the function from part (b) and determine the value of *x* that would make the installation cost minimum.
- (f) Before proceeding further with the installation, you check the local regulations for cable companies and find that there is pending state legislation that says that the cable cannot turn off the highway more than 0.5 mile from the Steven's driveway. If this legislation passes, what will be the ultimate cost of installing the Steven's cable?
- (g) If the cable company wishes to install cable in 5000 homes in this area, and assuming that the figures for the Steven's installation are typical, how much will the new legislation cost the company overall if they cannot use the cheapest installation cost, but instead have to follow the new state regulations?

- 4. **Oil Spill** An oil tanker strikes a sand bar that rips a hole in the hull of the ship. Oil begins leaking out of the tanker with the spilled oil forming a circle around the tanker. The radius of the circle is increasing at the rate of 2.2 feet per hour.
  - (a) Write the area of the circle as a function of the radius *r*.
  - (b) Write the radius of the circle as a function of time t.
  - (c) What is the radius of the circle after 2 hours? What is the radius of the circle after 2.5 hours?
  - (d) Use the result of part (c) to determine the area of the circle after 2 hours and 2.5 hours.
  - (e) Determine a function that represents area as a function of time *t*.
  - (f) Use the result of part (e) to determine the area of the circle after 2 hours and 2.5 hours.
  - (g) Compute the average rate of change of the area of the circle from 2 hours to 2.5 hours.
  - (h) Compute the average rate of change of the area of the circle from 3 hours to 3.5 hours.
  - (i) Based on the results obtained in parts (g) and (h), what is happening to the average rate of change of the area of the circle as time passes?
  - (j) If the oil tanker is 150 yards from shore, when will the oil spill first reach the shoreline? (1 yard = 3 feet)
  - (k) How long will it be until 6 miles of shoreline is contaminated with oil? (1 mile = 5280 feet)
